Delay-Tolerant Networking Bundle Protocol IANA Registries

Abstract

The Delay-Tolerant Networking (DTN) Research Group research group has defined many protocols such as the Bundle Protocol and Licklider Transmission Protocol. The specifications of these protocols contain fields that are subject to a registry. For the purpose of its research work, the group created ad hoc registries. As the specifications are stable and have multiple interoperable implementations, the group would like to hand off the registries to IANA for official custody. This document describes the actions executed by IANA.

Status of This Memo

This document is not an Internet Standards Track specification; it is published for informational purposes.

This document is a product of the Internet Research Task Force (IRTF). The IRTF publishes the results of Internet-related research and development activities. These results might not be suitable for deployment. This RFC represents the consensus of the Delay-Tolerant Network Research Group of the Internet Research Task Force (IRTF). Documents approved for publication by the IRSG are not a candidate for any level of Internet Standard; see Section 2 of RFC 5741.

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at http://www.rfc-editor.org/info/rfc6255.

1. Introduction

The DTNRG research group has defined many protocols relevant to the DTN architecture [RFC4838] such as the Bundle Protocol [RFC5050] and Licklider Transmission Protocol [RFC5326]. The specifications of these protocols contain fields that are subject to a registry. For the purpose of its research work, the group created ad hoc registries (http://www.dtnrg.org/wiki/AssignedNamesAndNumbers). As the specifications are stable and have multiple interoperable implementations, the group would like to hand off the registries to IANA for official custody. This document describes the actions executed by IANA.

2. Treatment of Flag Fields Encoded Using SDNVs

The DTN protocols use several extensible bit flag fields that are encoded as Self-Delimiting Numeric Values (SDNVs) as defined in Section 4.1 of [RFC5050]. For these fields, the registry specifies the allocation and usage of bit positions within the unencoded field. The SDNV encoding treats the ensemble of bits in the unencoded value as a numeric value to be encoded on transmission and decoded on reception as described in [RFC5050].

Processing of SDNV-encoded flags is discussed in [RFC6256].

Section 4.1 of [RFC5050] specifies that implementations are not required to handle SDNVs with more than 64 bits in their unencoded value. Accordingly, SDNV-encoded flag fields should be limited to 64 bit positions.

[Page 2]

IANA registry policies and wording used in this document are described in [RFC5226].

3. Bundle Protocol

The Bundle Protocol (BP) [RFC5050] has fields requiring a registry managed by IANA.

3.1. Bundle Block Types

The Bundle Protocol has a Bundle Block Type code field (Section 4.5.2) [RFC5050]. An IANA registry has been set up as follows.

The registration policy for this registry is:

0-191: Specification Required

192-255: Private or experimental use. No assignment by IANA.

The Value range is: unsigned 8-bit integer.

Bundle Block Type Registry

Value	Description	Reference
0 1 2-191 192-255	Reserved Bundle Payload Block Unassigned Private and/or Experimental Use	This document [RFC5050] [RFC5050]

The value "0" was not defined in any document or in the ad hoc registry. As per consensus by the DTNRG research group, it is reserved per this document.

3.2. Primary Bundle Protocol Version

The Bundle Protocol has a version field (see Section 4.5.1 of [RFC5050]). An IANA registry has been set up as follows.

The registration policy for this registry is: RFC Required

The Value range is: unsigned 8-bit integer.

Value	Description	Reference
6	Reserved Assigned Unassigned	This document

The value "0-5" was not defined in any document or in the ad hoc registry. As per consensus by the DTNRG research group, it is reserved per this document.

3.3. Bundle Processing Control Flags

The Bundle Protocol has a Bundle Processing Control Flags field (see Section 4.2 of [RFC5050]) encoded as an SDNV (see Section 2). An IANA registry has been set up as follows.

The registration policy for this registry is: Specification Required

The Value range is: Variable length. Maximum number of flag bit positions: 64

Bundle Processing Control Flags Registry

3.4. Block Processing Control Flags

The Bundle Protocol has a Block Processing Control Flags field (see Section 4.3 of [RFC5050]). An IANA registry has been set up as follows.

The registration policy for this registry is: Specification Required

The Value range is: Variable length. Maximum number of flag bit positions: 64

3.5. Bundle Status Report Flags

The Bundle Protocol has a Status Report Status Flag field (see Section 6.1.1 of [RFC5050]). An IANA registry has been set up as follows.

The registration policy for this registry is: RFC Required

The Value range is: 8 bits.

Bundle Status Report Flags Registry

RFC 6255

The value "00000000" was not defined in any document or in the ad hoc registry. As per consensus by the DTNRG research group, it is reserved per this document.

3.6. Bundle Status Report Reason Codes

The Bundle Protocol has a Bundle Status Report Reason Codes field (see Section 6.1.1 of [RFC5050]). An IANA registry has been set up as follows.

The registration policy for this registry is: Specification Required

The Value range is: unsigned 8-bit integer.

Bundle Status Report Reason Codes Registry

Value	Description	Reference
0	No additional information	[RFC5050]
1	Lifetime expired	[RFC5050]
2	Forwarded over unidirectional link	[RFC5050]
3	Transmission canceled	[RFC5050]
4	Depleted storage	[RFC5050]
5	Destination endpoint ID unintelligible	[RFC5050]
6	No known route to destination from here	[RFC5050]
7	No timely contact with next node on route	[RFC5050]
8	Block unintelligible	[RFC5050]
9-254	Unassigned	
255	Reserved	This document

The value "255" was not defined in any document or in the ad hoc registry. As per consensus by the DTNRG research group, it is reserved per this document.

3.7. Bundle Custody Signal Reason Codes

The Bundle Protocol has a Bundle Custody Signal Reason Codes field (see Section 6.1.2 of [RFC5050]). An IANA registry has been set up as follows.

The registration policy for this registry is: Specification Required

The Value range is: unsigned 7-bit integer.

127	Reserved	This document

Bundle Custody Signal Reason Codes Registry

The value "127" was not defined in any document or in the ad hoc registry. As per consensus by the DTNRG research group, it is reserved per this document.

4. Security Considerations

This document requests the creation of registries managed by IANA. There are no security issues involved. Refer to the Security Considerations section of the referenced protocols.

5. IANA Considerations

IANA has created the registries as described in the previous sections.
