## A YANG Data Model for Microwave Radio Link

### Abstract

This document defines a YANG data model for control and management of radio link interfaces and their connectivity to packet (typically Ethernet) interfaces in a microwave/millimeter wave node. The data nodes for management of the interface protection functionality is broken out into a separate and generic YANG data model in order to make it available for other interface types as well.

### Status of This Memo

This is an Internet Standards Track document.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on Internet Standards is available in Section 2 of RFC 7841.

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at  
<https://www.rfc-editor.org/info/rfc8561>.

## 1. Introduction

This document defines a YANG data model for management and control of the radio link interface(s) and the relationship to packet (typically Ethernet) and/or Time-Division Multiplexing (TDM) interfaces in a microwave/millimeter wave node. The ETSI EN 302 217 series defines the characteristics and requirements of microwave/millimeter wave equipment and antennas. Specifically, ETSI EN 302 217-2 [EN302217-2] specifies the essential parameters for systems operating from 1.4 GHz to 86 GHz. The data model includes configuration and state data according to the new Network Management Datastore Architecture [RFC8342].

The design of the data model follows the framework for management and control of microwave and millimeter wave interface parameters defined in [RFC8432]. This framework identifies the need and the scope of the YANG data model, use cases, and requirements that the model needs to support. Moreover, it provides a detailed gap analysis to identify the missing parameters and functionalities of the existing and established models to support the specified use cases and requirements, and based on that, it recommends how the gaps should be filled with the development of the new model. According to the conclusion of the gap analysis, the structure of the data model is based on the structure defined in [MICROWAVE-RADIO-LINK], and it augments [RFC8343] to align with the same structure for management of the packet interfaces. More specifically, the model will include interface layering to manage the capacity provided by a radio link terminal for the associated Ethernet and TDM interfaces, using the principles for interface layering described in [RFC8343] as a basis.

The data nodes for management of the interface protection functionality is broken out into a separate and generic YANG data module in order to make it also available for other interface types.

The designed YANG data model uses established microwave equipment and radio standards, such as ETSI EN 302 217-2; the IETF Radio Link Model [MICROWAVE-RADIO-LINK]; and the ONF Microwave Model [ONF-model], as the basis for the definition of the detailed leafs/parameters, and it proposes new ones to cover identified gaps, which are analyzed in [RFC8432].

### 1.1. Terminology and Definitions

The following terms are used in this document:

Carrier Termination (CT) is an interface for the capacity provided over the air by a single carrier. It is typically defined by its transmitting and receiving frequencies.

Radio Link Terminal (RLT) is an interface providing packet capacity and/or TDM capacity to the associated Ethernet and/or TDM interfaces in a node and is used for setting up a transport service over a microwave/millimeter wave link.

The following acronyms are used in this document:

ACM: Adaptive Coding Modulation

ATPC: Automatic Transmitter Power Control

BBE: Background Block Error

BER: Bit Error Ratio

BPSK: Binary Phase-Shift Keying

CM: Coding Modulation

CT: Carrier Termination

ES: Errored Seconds

IF: Intermediate Frequency

MIMO: Multiple Input Multiple Output

RF: Radio Frequency

RLT: Radio Link Terminal

QAM: Quadrature Amplitude Modulation

QPSK: Quadrature Phase-Shift Keying

RTPC: Remote Transmit Power Control

SES: Severely Errored Seconds

TDM: Time-Division Multiplexing

UAS: Unavailable Seconds

XPIC: Cross Polarization Interference Cancellation

## 1.2. Tree Structure

A simplified graphical representation of the data model is used in Section 2.1 of this document. The meaning of the symbols in these diagrams is defined in [RFC8340].

## 2. Microwave Radio Link YANG Data Model

## 2.2. Explanation of the Microwave Data Model

The leafs in the Interface Management Module augmented by RLT and CT are not always applicable.

"/interfaces/interface/enabled" is not applicable for RLT. Enable and disable of an interface is done in the constituent CTs.

The packet-related measurements "in-octets", "in-unicast-pkts", "in-broadcast-pkts", "in-multicast-pkts", "in-discards", "in-errors", "in-unknown-protos", "out-octets", "out-unicast-pkts", "out-broadcast-pkts", "out-multicast-pkts", "out-discards", and "out-errors" are not within the scope of the microwave radio link domain and therefore are not applicable for RLT and CT.

## 3. Microwave Radio Link YANG Data Model

This module imports typedefs and modules from [RFC6991], [RFC8343] and [RFC7224], and it references [TR102311], [EN302217-1], [EN301129], and [G.826].

#### 4. Interface Protection YANG Data Model

The data nodes for management of the interface protection functionality is broken out from the Microwave Radio Link Module into a separate and generic YANG data model in order to make it also available for other interface types.

This module imports modules from [RFC8343], and it references [G.808.1].

```
<CODE BEGINS> file "ietf-interface-protection@2019-06-19.yang"

## 5. Microwave Types YANG Data Model

This module defines a collection of common data types using the YANG data modeling language. These common types are designed to be imported by other modules defined in the microwave area.

```

<CODE ENDS>

## 6. Security Considerations

The YANG data models specified in this document define schemas for data that is designed to be accessed via network management protocols such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [RFC6242]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC8446].

The Network Configuration Access Control Model (NACM) [RFC8341] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in these YANG data models that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

Interfaces of type microwaveRadioLinkTerminal:

```
/if:interfaces/if:interface/mode,  
/if:interfaces/if:interface/carrier-terminations,  
/if:interfaces/if:interface/rlp-groups,  
/if:interfaces/if:interface/xpic-pairs,  
/if:interfaces/if:interface/mimo-groups, and  
/if:interfaces/if:interface/tdm-connections:
```

These data nodes represent the configuration of the radio link terminal, and they need to match the configuration of the radio link terminal on the other side of the radio link. Unauthorized access to these data nodes could interrupt the ability to forward traffic.

Interfaces of type microwaveCarrierTermination:

```
/if:interfaces/if:interface/carrier-id,  
/if:interfaces/if:interface/tx-enabled,  
/if:interfaces/if:interface/tx-frequency,  
/if:interfaces/if:interface/rx-frequency,  
/if:interfaces/if:interface/duplex-distance,  
/if:interfaces/if:interface/channel-separation,  
/if:interfaces/if:interface/rtpc/maximum-nominal-power,
```

```
/if:interfaces/if:interface/atpc/maximum-nominal-power,  
/if:interfaces/if:interface/atpc/atpc-lower-threshold,  
/if:interfaces/if:interface/atpc/atpc-upper-threshold,  
/if:interfaces/if:interface/single/selected-cm,  
/if:interfaces/if:interface/adaptive/selected-min-acm,  
/if:interfaces/if:interface/adaptive/selected-max-acm,  
/if:interfaces/if:interface/if-loop, and  
/if:interfaces/if:interface/rf-loop:
```

These data nodes represent the configuration of the carrier termination, and they need to match the configuration of the carrier termination on the other side of the carrier. Unauthorized access to these data nodes could interrupt the ability to forward traffic.

Radio link protection:

```
/radio-link-protection-groups/protection-group:
```

This data node represents the configuration of the protection of carrier terminations. Unauthorized access to this data node could interrupt the ability to forward traffic or remove the ability to perform a necessary protection switch.

XPIC:

```
/xpic-pairs:
```

This data node represents the XPICT configuration of a pair of carriers. Unauthorized access to this data node could interrupt the ability to forward traffic.

MIMO:

```
/mimo-groups:
```

This data node represents the MIMO configuration of multiple carriers. Unauthorized access to this data node could interrupt the ability to forward traffic.

Some of the RPC operations in this YANG data model may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations. These are the operations and their sensitivity/vulnerability:

Radio link protection:

```
/radio-link-protection-groups/protection-group/manual-switch-working,  
/radio-link-protection-groups/protection-group/  
    manual-switch-protection,  
/radio-link-protection-groups/protection-group/forced-switch,  
/radio-link-protection-groups/protection-group/lockout-of-protection,  
/radio-link-protection-groups/protection-group/freeze,  
/radio-link-protection-groups/protection-group/exercise, and  
/radio-link-protection-groups/protection-group/clear
```

These data nodes represent actions that might have an impact on the configuration of the protection of carrier terminations. Unauthorized access to these data nodes could interrupt the ability to forward traffic or remove the ability to perform a necessary protection switch.

The security considerations of [RFC8343] also apply to this document.

## 7. IANA Considerations

IANA has assigned new URIs from the "IETF XML Registry" [RFC3688] as follows:

URI: urn:ietf:params:xml:ns:yang:ietf-microwave-radio-link  
Registrant Contact: The IESG  
XML: N/A; the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-interface-protection  
Registrant Contact: The IESG  
XML: N/A; the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-microwave-types  
Registrant Contact: The IESG  
XML: N/A; the requested URI is an XML namespace.

IANA has recorded YANG module names in the "YANG Module Names" registry [RFC6020] as follows:

```
Name: ietf-microwave-radio-link
Maintained by IANA?: N
Namespace: urn:ietf:params:xml:ns:yang:ietf-microwave-radio-link
Prefix: mrl
Reference: RFC 8561

Name: ietf-interface-protection
Maintained by IANA?: N
Namespace: urn:ietf:params:xml:ns:yang:ietf-interface-protection
Prefix: ifprot
Reference: RFC 8561

Name: ietf-microwave-types
Maintained by IANA?: N
Namespace: urn:ietf:params:xml:ns:yang:ietf-microwave-types
Prefix: mw-types
Reference: RFC 8561
```

IANA has registered the following ifTypes in "ifType definitions" under [IANA-SMI]:

Decimal	Name	Description
295	microwaveCarrierTermination	air interface of a single microwave carrier
296	microwaveRadioLinkTerminal	radio link interface for one or several aggregated microwave carriers

## Appendix A. Example: 1+0 and 2+0 Configuration Instances

This section gives simple examples of 1+0 and 2+0 instances using the YANG data model defined in this document. The examples are not intended as a complete module for 1+0 and 2+0 configuration.

### A.1. 1+0 Instance

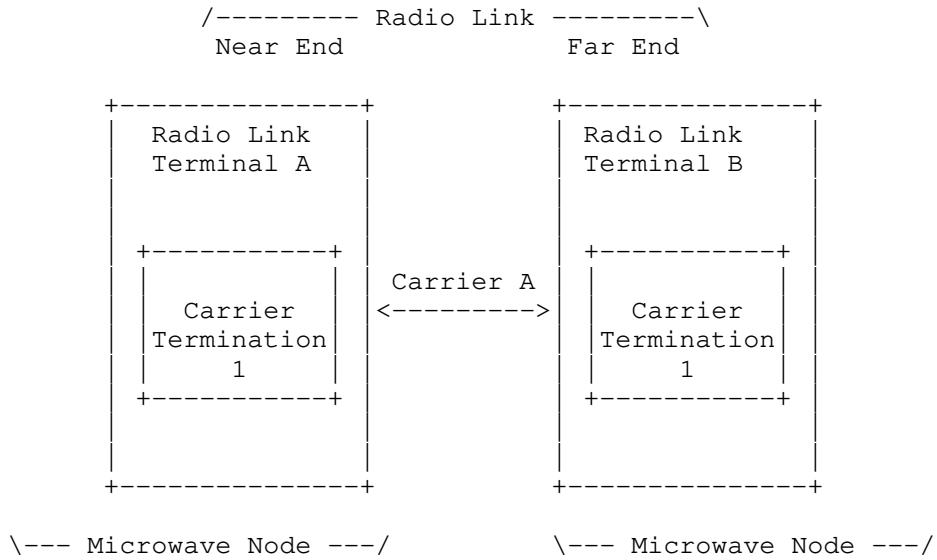

Figure 1: 1+0 Example

Figure 1 shows a 1+0 example. The following instance shows the 1+0 configuration of the Near End node.

```
"interface": [
    {
        "name": "RLT-A",
        "description": "Radio Link Terminal A",
        "type": "microwaveRadioLinkTerminal",
        "id": "RLT-A",
        "mode": "one-plus-zero",
        "carrier-terminations": [
            "RLT-A:CT-1"
        ],
        "tdm-connections": [
            "tdm-type": "E1",
            "tdm-connections": "4"
        ]
    },
    {
        "name": "RLT-A:CT-1",
        "description": "Carrier Termination 1",
        "type": "microwaveCarrierTermination",
        "carrier-id": "A",
        "tx-enabled": true,
        "tx-frequency": 10728000,
        "duplex-distance": 644000,
        "channel-separation": 28000,
        "polarization": not-specified,
        "rtcp": {

### A.2. 2+0 Instance

Figure 2 shows a 2+0 example.

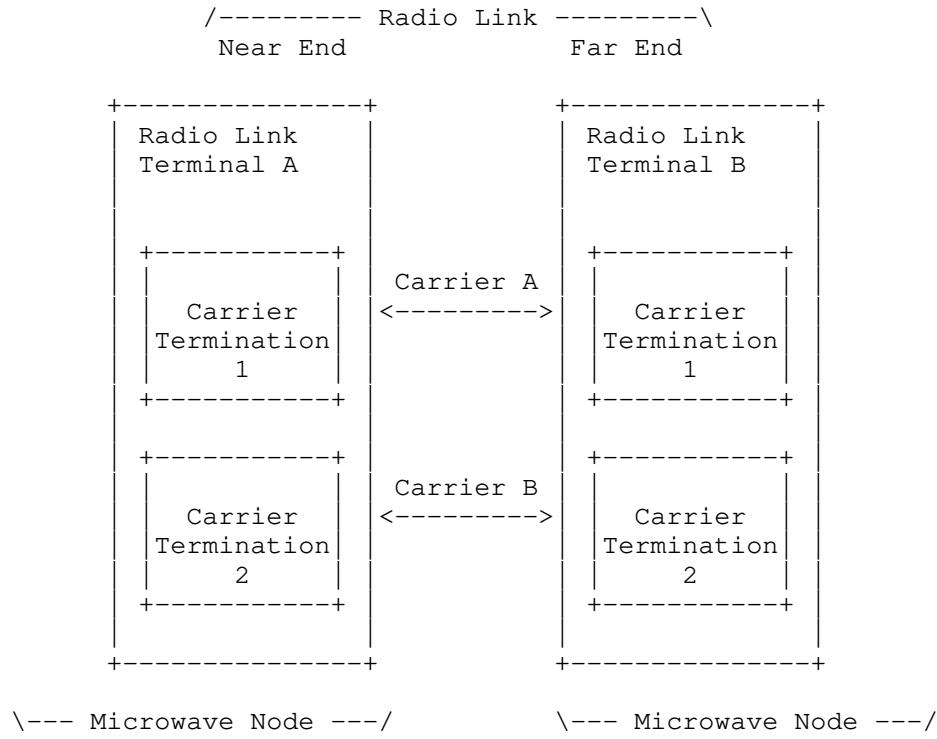

Figure 2: 2+0 Example

The following instance shows the 2+0 configuration of the Near End node.

```

"interface": [
  {
    "name": "RLT-A",
    "description": "Radio Link Terminal A",
    "type": "microwaveRadioLinkTerminal",
    "id": "RLT-A",
    "mode": "two-plus-zero",
    "carrier-terminations": [
      "RLT-A:CT-1",
      "RLT-A:CT-2"
    ],
  }
]
  
```

```
"tdm-connections": [
    "tdm-type": "E1",
    "tdm-connections": "4"
]
},
{

  "name": "RLT-A:CT-1",
  "description": "Carrier Termination 1",
  "type": "microwaveCarrierTermination",
  "carrier-id": "A",
  "tx-enabled": true,
  "tx-frequency": 10728000,
  "duplex-distance": 644000,
  "channel-separation": 28000,
  "polarization": not-specified,
  "rtpc": {
    "maximum-nominal-power": 20
  },
  "single": {
    "selected-cm": "qam-512"
  }
},
{
  "name": "RLT-A:CT-2",
  "description": "Carrier Termination 2",
  "type": "microwaveCarrierTermination",
  "carrier-id": "B",
  "tx-enabled": true,
  "tx-oper-status": on,
  "tx-frequency": 10618000,
  "duplex-distance": 644000,
  "channel-separation": 28000,
  "polarization": not-specified,
  "rtpc": {
    "maximum-nominal-power": 20
  },
  "single": {
    "selected-cm": "qam-512"
  }
}
]
```

### A.3. 2+0 XPIC Instance

The following instance shows the XPIC configuration of the Near End node.

```
"interface": [
    {
        "name": "RLT-A",
        "description": "Radio Link Terminal A",
        "type": "microwaveRadioLinkTerminal",
        "id": "RLT-A",
        "mode": "two-plus-zero",
        "carrier-terminations": [
            "RLT-A:CT-1",
            "RLT-A:CT-2"
        ],
        "xpic-pairs": [
            "RLT-A:CT-1",
            "RLT-A:CT-2"
        ],
        "tdm-connections": [
            "tdm-type": "E1",
            "tdm-connections": "4"
        ]
    },
    {
        "name": "RLT-A:CT-1",
        "description": "Carrier Termination 1",
        "type": "microwaveCarrierTermination",
        "carrier-id": "A",
        "tx-enabled": true,
        "tx-frequency": 10728000,
