1 Description

The problem of fetching Bible verses was suggested to me by my friend Tom Price. He plans to write Bible lessons, notes and handouts will be prepared using L^AT_EX and these packages (`bibpes` and `fetchbibpes`).

This is a companion package to `bibpes`. Use the commands of this package to fetch the Bible passages that the `bibpes` package has defined.

The major commands of this package are `\fetchverse` and `\fetchverses`, latter one being more powerful than the former. The syntax for these two are,

```
\fetchverse[⟨opts⟩]{⟨book⟩⟨ch⟩:⟨vrs⟩}
\fetchverses*[⟨opts⟩]{⟨book⟩⟨ch⟩:⟨vrs⟩} or
\fetchverses*[⟨opts⟩]{⟨book⟩⟨ch⟩:⟨vrs₁⟩-⟨vrs₂⟩}
```

where `⟨opts⟩` are defined options of the `fbpes` family; `⟨book⟩` is either the three letter book abbreviation that e-Sword uses (as given in the **e-Sword Abbr** column of [Table 1](#)) or is an alternate abbreviation (as given in the **Alt_Abbr** column of [Table 1](#)); `⟨ch⟩:⟨vrs⟩` is a chapter-verse reference. The `\fetchverse` command only fetches a single verse, while `\fetchverses` can fetch multiple verses (by the syntax `⟨ch⟩:⟨vrs₁⟩-⟨vrs₂⟩`); when you specify no upper limit to the range (`⟨ch⟩:⟨vrs₁⟩-`), all verses starting with `⟨vrs₁⟩` will be included up to the first verse that is undefined (in the same chapter). The run of verses must all be from the same chapter. The '*' parameter is optional, when present the book and verse references are shown, otherwise they are not. We illustrate with `Gen 1:1`, `Gen 1:1-2`, and `Gen 1:1-`.

- `\fetchverse{Gen 1:1}: (Gen 1:1)` In the beginning God created the heaven and the earth.
- `\fetchverses{Gen 1:1}: (Gen 1:1)` In the beginning God created the heaven and the earth.
- `\fetchverses*{Gen 1:1}: (Gen 1:1)` In the beginning God created the heaven and the earth.
- `\fetchverses*{Gen 1:1-2}: (Gen 1:1)` In the beginning God created the heaven and the earth. ²And the earth was without form, and void; and darkness was upon the face of the deep. And the Spirit of God moved upon the face of the waters.
- `\fetchverses*{Gen 1:1-}: (Gen 1:1)` In the beginning God created the heaven and the earth. ²And the earth was without form, and void; and darkness was upon the face of the deep. And the Spirit of God moved upon the face of the waters. ³And God said, Let there be light: and there was light. ⁴And God saw the light, that it was good: and God divided the light from the

darkness. ⁵And God called the light Day, and the darkness he called Night.
And the evening and the morning were the first day.

Table 1: e-Sword abbreviations

Package syntax. Basic syntax is as follows:

```
\usepackage[useverses={Gen1,Mat2,Rom1,1Cor1,1Ki1}]{fetchbipes}
```

The package option, `useverses`, a comma-delimited base names for DEF file created by `bipes`. The listed base name DEF files contain verses that are to be referenced and fetched from the files. These files should be located in the folder containing the source file of the document.

In addition to the `useverses`, `useselverses` is an option that tries to economize memory usage, refer to [Section 5](#) for details; the `usesr` option is a specialize

option that brings in the definition of the `\sr` command, see [Section 6](#) for more information.

Demo file: `bibpes.tst.tex`.

2 Documentation and Code

We begin by requiring `xkeyval`.

```
2 \RequirePackage{xkeyval}
```

We borrow a convenient utility command from the `comment` package.

```
3 \def\csarg#1#2{\expandafter#1\csname#2\endcsname}
4 \let\fb@Zero=0 \let\fb@One=1 \let\fb@Two=2
```

2.1 Package options

deffolder The `deffolder` option allows the author to specify a folder wherein the DEF files are found, usually, a relative path.

```
5 \define@key{fetchbibpes.sty}{deffolder}{\def\@rgi{#1}\ifx\@rgi\@empty
6   \let\fb@deffolder\@empty\else\def\fb@deffolder{#1}\fi}
7 \let\fb@deffolder\@empty
```

useverses The `useverses` option key is required. It takes as its value a comma-delimited list of basenames that have DEF extensions.

```
useverses={Gen1,Mat1,Rom1}
```

where, `Gen1.def`, `Mat1.def`, `Rom1.def` are expected to be found on the user's hard drive.

```
8 \define@key{fetchbibpes.sty}{useverses}[] {\def\fbpes@useverses{#1}}
9 \let\fbpes@useverses\@empty
```

useselverses The `useselverses` brings in `selfetch.def`, which enables selected retrieval (selected fetching) of verses. See [Section 5](#) for the definitions.

```
10 \define@key{fetchbibpes.sty}{useselverses}[] {%
11   \AtEndOfPackage{\InputIfFileExists{selfetch.def}}
12   {\fetchInputMsg}{\fetchWarningMsg}}%
13 }
14 \def\fetchInputMsg{\PackageInfo{fetchbibpes}
15   {useselverses option,\MessageBreak
16    inputting file selfetch.def}}
17 \def\fetchWarningMsg{\PackageWarning{fetchbibpes}
18   {useselverses option,\MessageBreak
19    cannot find file selfetch.def}}
```

usesr The `usesr` brings in `sr.def`, which defines the `\sr` command. See [Section 6](#) for the definition.

```
20 \define@key{fetchbibpes.sty}{usesr}[] {%
21   \AtEndOfPackage{\InputIfFileExists{sr.def}}
22   {\srInputMsg}{\srWarningMsg}}%
```

```

23 }
24 \def\srInputMsg{\PackageInfo{fetchbibpes}
25   {usesr option detected, inputting file sr.def}}
26 \def\srWarningMsg{\PackageWarning{fetchbibpes}
27   {usesr option detected, cannot find file sr.def}}

28 \newif\iffetchsubstr \fetchsubstrfalse
29 \newif\ifparsefetcharg \parsefetchargtrue
30 \define@key{fetchbibpes.sty}{fetchsubstr}[] {\fetchsubstrtrue
31   \AtEndOfPackage{\InputIfFileExists{fsubstr.def}}
32   {\fsbstrInputMsg}{\fsbstrWarningMsg}}%
33 }
34 \define@key{fetchbibpes.sty}{fetchsubtr}[]%
35   {\ExecuteOptionsX{fetchsubtr}}
36 \def\fsbstrInputMsg{\PackageInfo{fetchbibpes}
37   {fetchsubtr option detected, inputting file fsubstr.def}}
38 \def\fsbstrWarningMsg{\PackageWarning{fetchbibpes}
39   {fetchsubtr option detected, cannot find file fsubstr.def}}

```

ignorecfg The `ignorecfg` causes this package not to input the CFG file `fbpes.cfg`.

```

40 \newif\iffb@ignorecfg \fb@ignorecfgfalse
41 \define@key{fetchbibpes.sty}{ignorecfg}[true]{\fb@ignorecfgtrue}

```

cfg=*(name)* We give the package user the option of having several configuration files, which can be specified through the `cfg` option; here *(name)* is the base name of the configuration file (*(name).cfg*). If `cfg` is not specified in the package option list, `fbpes.cfg` is used for the configuration file, unless the `ignorecfg` option is in effect.

```

42 \define@key{fetchbibpes.sty}{cfg}[fbpes]{\def\fb@cfg@basename{\#1}}
43 \def\fb@cfg@basename{fbpes}

```

We process the options for this package.

```
44 \ProcessOptionsX
```

If the user has not passed a value for the `userverses`, we send a warning to the user.

```

45 \let\fb@NO=n
46 \let\fb@YES=y
47 \def\fbp@none{none}
48 \ifx\fbpes@useverses\empty
49   \PackageWarning{fetchbibpes}
50   {The useverses option is not present.\MessageBreak
51     At lease one DEF file is advised}
52 \else
53   \ifx\fbpes@useverses\fbp@none\let\fbpes@useverses\empty\fi
54 \fi

```

2.2 The `\BV` command *et al.*

`\BV(⟨verse-ref⟩⟨passage⟩\null`

The Bible verses are stored in a separate file (DEF) or declared within the

`declareBVs` environment. (The companion package, `bibpes`, writes a DEF file.) In either case, a Bible verse is one of the arguments of the `\BV` command, the syntax of which is given below.

```
\BV(<book> □ <chapter> : <verse> □ <transl> [ □ <word> ]) □ <passage> \null
```

Note that the `<verse-ref>` is enclosed in parentheses, not braces. The symbol `□` is a space-character (not a hard space). The `<passage>` ends with a `\null`, which acts as a delimiter for the `\BV` macro. For example,

```
\BV(Mat 2:1 KJV) Now when Jesus was born...to Jerusalem,\null  
\BV(Mat 2:1 ISV) ... \null
```

Generally, the abbreviated names (e-Sword abbreviations) of the books are used. Only one verse per chapter is written to the DEF file. The definition for `\BV` is given next, though `\BV` is redefined when the `usesr` option is specified.

(2018/03/21) Sometimes eSword inserts a characters (null?) after the left parenthesis. This does not happen often. Added a new argument #2 that will gobble this extraneous character, we hope.

```
55 \%def\BV(#1) #2\null{\csarg\gdef{#1}{#2}}  
56 \def\BV(#1)#2 #3\null{\csarg\gdef{#1}{#3}}
```

`declareBVs` is a convenience environment used to make `\BV` declarations.

```
\begin{declareBVs}  
\BV(Gen 1:1 KJV Mrk) \textit{In the beginning} God created the heaven  
and the earth.\null  
\end{declareBVs}
```

where we have wrapped the line to display it within the margins. The environment should appear in vertical mode.

```
57 \newenvironment{declareBVs}{\cvrtdqs}{  
58 \newenvironment{declareBVs*}{\{}{\}}
```

`\usePassage{<verse-ref>}` takes the raw `<verse-ref>` and expands to the associated passage: `\usePassage{Gen 1:1 KJV}` should produce the referenced passage, provided this reference has been defined.

```
59 \def\usePassage#1{\@nameuse{#1}  
  
60 \iffetchsubstr  
61     \AtEndDocument{  
62         \ifx\wrtToJBV\fb@YES  
63             \immediate\write\bvout{\string\end{declareBVs*}}%  
64             \immediate\closeout\bvout\fi}  
65     \AtBeginDocument{\InputIfFileExists{\jobname-bv.cut}  
66         {\PackageInfo{fetchbibpes}{Inputting \jobname-bv.cut}}  
67         {\PackageInfo{fetchbibpes}{Cannot find \jobname-bv.cut}}}  
68 \fi
```

2.3 Formatting the names of the books

```
69 \def\bookFmt#1#2#3#4{\csarg\def{bkfmt#1}{\{#1\}\{#2\}\{#3\}\{#4\}}}
```

The books and their visual representations. The first argument is the e-Sword three-letter name, the second is the full name, the third is a long abbreviation, and the fourth is a short abbreviation.

```

2.4 Key-values for the fetch commands

We now define a `xkeyval` family `fbpes` to control how the book names are displayed.

`abbr` The `abbr` key designates how the book is displayed, possible values are `esword`, `none`, `long`, and `short`; these corresponding to the arguments 1–4 of `\bookFmt`.

```

136 \define@choicekey+{fbpes}{abbr}[\val\nr]%
137   {esword,none,long,short}[esword]{%
138     \ifcase\nr\relax
139       \def\fbpes@abbr{\ioiv}\or
140       \def\fbpes@abbr{\iiiov}\or
141       \def\fbpes@abbr{\iiioiv}\or
142       \def\fbpes@abbr{\ivoiv}\fi
143 }{%

```

The values of `abbr` use the arguments of `\bookFmt` (`esword` is argument #1; `none` is argument #2; `long` is argument #3; `short` is argument #4).

Examples

- `\fetchverse[abbr=esword]{Gen 1:1}`: (Gen 1:1) In the beginning God created the heaven and the earth.
- `\fetchverse[abbr=none]{Gen 1:1}`: (Genesis 1:1) In the beginning God created the heaven and the earth.

- `\fetchverse[abbr=long]{Gen 1:1}`: (Gen. 1:1) In the beginning God created the heaven and the earth.
- `\fetchverse[abbr=short]{Gen 1:1}`: (Gn. 1:1) In the beginning God created the heaven and the earth.

roman The `roman` key determines how book numbers are displayed, ‘1 Corinthians’ versus ‘I Corinthians’, for example. Possible values are `true` (use roman letters) or `false` (use arabic numbers).

```
144 \define@boolkey{fbpes}{roman}[true]{\ifKV@fbpes@roman
145   \def\fb@numi{I}\def\fb@numii{II}\def\fb@numiii{III}\else
146   \def\fb@numi{1}\def\fb@numii{2}\def\fb@numiii{3}\fi
147 }
```

This key has no effect when `abbr=esword`.

Examples

- (1 Cor. 1:1) Paul, called to be an apostle of Jesus Christ through the will of God, and Sosthenes our brother,
- (I Cor. 1:1) Paul, called to be an apostle of Jesus Christ through the will of God, and Sosthenes our brother,

from The value of the `from` key is the Bible version to be used. For example, `from=ISV`. When present, this is affixed to the passage reference.

```
\BV(book\_chapter:verse\_bible)\_passage\_\null
```

The `from` key, see below, only supports KJV, KJV+, ISV, these are the versions of the Bible that I used for testing. If someone wants to use ASV (American Standard Version), he can either make a personal copy of `fetchbibpes.sty` and add ASV, for example, onto the list in the choice key definition for `from` below, or he can use `\addtobibles`.

```
148 \newif\if@ddtobiblesUsed \@ddtobiblesUsedfalse
```

\defaultBible The `\defaultBible` sets the default Bible. Then if you say `\defaultBible{NKJV}` then `fetchverse{Gen 1:1}` attempts to fetch the NKJV of Gen 1:1. In this way, you don’t have to use the `from` option for the version of the Bible you are using the most.

```
149 \newcommand{\defaultBible}[1]{\def\@rg{\#1}\ifx\@rg\empty
150   \else\gdef\fbdefaultBible{\#1}\def\fbpes@from{\ #1}\fi}
151 \defaultBible{KJV}
```

\addtobibles Use this command to add to the list of supported Bible versions. To add to the list of supported Bible versions, in the preamble expand `\addtobibles{ASV}`, for example. The argument for `\addtobibles` is a comma-delimited list of abbreviations uses by e-Sword to designate various Bible translations.

```
152 \newcommand\addtobibles[1]{%
```

If the argument is empty, we ignore; otherwise, we set `\@ddtoBiblesUsedtrue` and create a new choice key consisting of the values passed to us by #1.

```

153   \def\@rgi{#1}\ifx\@rgi\@empty\else
154     \global\@ddtoBiblesUsedtrue\fi
155     \define@choicekey+{bibadd}{addfrom}[\val\nr]{#1}{}
156       {\PackageWarning{fetchbibpes}{Bad Choice of \val\MessageBreak
157         will use \fbdefaultBible\space instead}%
158       \edef\fbpes@from{\fbdefaultBible}%
159     }%
160 \onlypreamble\addtoBibles

```

If `\addtoBibles` has been expanded in the preamble, we determine if the argument #1 is in the new list of Bibles, if yes, OK; otherwise, we emit a warning and default to KJV.

```

161 \def\handleUnRegBibles#1{\edef\@rgi{#1}\if@ddtoBiblesUsed
162   \edef\fbpes@babbr{#1}\edef\x{\noexpand
163     \setkeys{bibadd}{addfrom=#1}}\x\else
164   \ifx\@rgi\@empty\edef\fbpes@babbr{\fbdefaultBible}\else
165     \PackageWarning{fetchbibpes}{Bad Choice of \val\MessageBreak
166       will use \fbdefaultBible\space instead}%
167     \edef\fbpes@babbr{\fbdefaultBible}\fi\fi
168   \edef\fbpes@from{\fbpes@babbr}%
169 }

```

from Now we define the `from` key, it has only three values, KJV, KJV+, and ISV, but through `\addtoBibles`, it can be extended.

```

170 \def\fbSetFromChoiceKey#1{%
171   \define@choicekey+{fbpes}{from}[\val\nr]{%
172     {#1}[]{\edef\fbpes@babbr{\val}\edef\fbpes@from{\val}}%
173     {\handleUnRegBibles{##1}}%
174   }\registerBibles#1{\fbSetFromChoiceKey{#1}}%
175 \registerBibles{KJV,KJV+,ISV}

```

Example `\fetchverse[abbr=none,from=ISV]{Gen 1:1}` yields,

(Genesis 1:1) In the beginning, God created the universe.

transl The `transl` key is an annotation key, that appends text on the end of the Bible reference, such as a translation: `transl=KJV`.

```

176 \define@key{fbpes}{transl}[]{\def\fbpes@transl{#1}%
177   \gdef\g@fbpes@transl{#1}\gdef\gtransl{#1}%
178 }%
179 \let\fbpes@transl\@empty

```

Example We annotate the translation version using ‘King James Version’.

```
\fetchverse[abbr=none,transl=King James Version]{Gen 1:1}
```

(Genesis 1:1 King James Version) In the beginning God created the heaven and the earth.

from* combines the actions of the options `from` and `transl`.

```
180 \define@key{fbpes}{from*}[]{\setkeys{fbpes}{from=#1,transl=#1}}
```

Example `\fetchverse[abbr=none,from*=ISV]{Gen 1:1}` yields,

(Genesis 1:1 ISV) In the beginning, God created the universe.

The value of the `from*` key must be a valid value of the `from` key.

We provide a mechanism for *alternate* phrasing of a passage through the `alt alt=<word>` key, perhaps an alternate provides of some formatting commands. If we say,

```
\fetchverse[from=ISV,alt=Alt]{1Ki 1:1}
```

(1Ki 1:1) When David had grown *very old*, they covered him with blankets, but he could not keep warm,

A line in one of the DEF file should have

```
\BV(1Ki 1:1 ISV Alt) When David had grown \emph{very old}, \dots\null
```

for example.

```
181 \newif\ifbpes@altstar\fbpes@altstarfalse
```

`\useOldAlt` Add a switch `\ifuseoldalt` to revert back to the old behavior of `alt` and supporting convenience commands `\useOldAlt` and `\useNewAlt`.

```
182 \newif\ifuseoldalt \useoldaltfalse
```

```
183 \def\useOldAlt{\useoldalttrue}
```

```
184 \def\useNewAlt{\useoldaltfalse}
```

```
185 \define@key{fbpes}{alt}[] {\def\@rgi{\#1}\ifx\@rgi\@empty
```

```
186     \let\fbpes@alt\@empty\else\def\fbpes@alt{\#1}\fi}
```

```
187 \let\fbpes@alt\@empty
```

`alt*` We add a new key `alt*` to process many alternate and normal Bible verses. The key is only obeyed for `\fetchverses`. Syntax is,

```
alt*={Alt,,Alt,Alt1,Paul,,,Special}
```

The length of this comma delimited ist must be equal to or less than as the number of verses being processed by `\fetchverses`. The first verse passes `alt=Alt`, the second has no `alt` key, the third passes `alt=Alt`, the fourth `alt=Alt1`, the fifth, `alt=Paul`, the sixth and seventh have no `alt` key specification, the last has `alt=Special`. Any further verses will have no `alt` key.

```
188 \define@key{fbpes}{alt*}[] {\def\@rgi{\#1}\ifx\@rgi\@empty
```

```
189     \let\fbpes@altstar\@empty\else\def\fbpes@altstar{\#1}\fi}
```

```
190 \let\fbpes@altstar\@empty
```

Only one of `alt` or `alt*` is allowed, this is enforced from within `\fetchverses`.

`delims` The `delims` key takes a value of two characters used to set off the Bible reference. The default is `delimin=()`. If `delims` appears in the option list without a value, then there is no characters delimiting the Bible passage.

```
191 \define@key{fbpes}{delims}[] {\def\fbp@getDelims{\#1}%
```

```
192     \ifx\fbp@getDelims\@empty\let\l@fbp@delim\@empty
```

```
193     \let\r@fbp@delim\@empty\else
```

```

194      \fbp@getDelimsi#1\@nil\fi}
195 \def\fbp@getDelimsi#1#2#3\@nil{\def\@rgiii{#3}\ifx\@rgiii\@empty
196     \def\l@fbp@delim{#1}\def\r@fbp@delim{#2}\else
197     \PackageWarning{fetchbibpes}{Only two delimiters expected, using the
198     defaults of '()' }\def\l@fbp@delim{()}\def\r@fbp@delim{()}\fi}
199 \def\l@fbp@delim{()}\def\r@fbp@delim{()}

```

Examples

1. `\fetchverse[abbr=none,delims]{Gen 1:1}`: Genesis 1:1 In the beginning God created the heaven and the earth.
2. `\fetchverse[abbr=none,delims={[]}]{Gen 1:1}`: [Genesis 1:1] In the beginning God created the heaven and the earth.
3. `\fetchverse[abbr=none,delims={According to }{,}]{Gen 1:1}`:

According to Genesis 1:1, In the beginning God created the heaven and the earth.

As seen item 2, with the delimiters as ‘[]’, they must be enclosed in braces because this all takes place within an optional argument, without the braces, the parsing of the optional argument fails. The `delims` expects two tokens, they need not be characters, they can be anything, as long as they are enclosed in matching braces. In item 3, we set `delims={According to }{,}`, the first token is placed before the passage reference, the second after; this results in a phrase that leads up to the passage itself.

enclosewith The value of `enclosewith` key is a set of two tokens. The first token is placed at the beginning of the passage, and the second one at the end of the passage. A special value of `\quote` is recognized, this places quotation marks around the passage.

```

200 \define@key{fbpes}{enclosewith}[]{\def\fbp@getEnclose{#1}%
201   \def\quote{{'{'}}{'}'}%
202   \ifx\fbp@getEnclose\@empty\let\l@fbp@enclose\@empty
203   \let\r@fbp@enclose\@empty\else
204   \expandafter\fbp@getEnclosei#1\@nil\fi}
205 \def\fbp@getEnclosei#1#2#3\@nil{\def\@rgiii{#3}\ifx\@rgiii\@empty
206   \def\l@fbp@enclose{#1}\def\r@fbp@enclose{#2}\else
207   \PackageWarning{fetchbibpes}{Only two tokens expected, using the
208   defaults of '' }\let\l@fbp@enclose\@empty
209   \let\r@fbp@enclose\@empty\fi}
210 \let\l@fbp@enclose\@empty\let\r@fbp@enclose\@empty

```

format `format` is a general key for making formatting declarations, for example, we format the reference using `format=\bfseries\sffamily`.

```

211 \define@key{fbpes}{format}{\def\fbp@format{#1}}
212 \let\fbp@format\relax

```

ltxquotes New key of `ltxquotes`. When the author uses the `ltxquotes`, it is expected that all passages referenced use L^AT_EX style quotes, perhaps had edited. That is, ‘‘In the beginning’’ instead of “In the beginning” and for single quotes ‘In the beginning’ instead of ’In the beginning’. In extraordinary situations, the switch `\ifNotL@TeXQuotes` may be turned on or off with `\LaTeXQuotesOn` and `\LaTeXQuotesOff`. Assuming the normal case that Bible passages do not use L^AT_EX style quoting, the default state is `\LaTeXQuotesOff`.

```
213 \newif\ifNotL@TeXQuotes \NotL@TeXQuotestrue
214 \def\LaTeXQuotesOn{\NotL@TeXQuotesfalse}
215 \def\LaTeXQuotesOff{\NotL@TeXQuotestrue}
216 \define@key{fbpes}{ltxquotes}[]{\NotL@TeXQuotesfalse}
```

Example `\fetchverse[format=\bfseries\sffamily]{Gen 1:1}` produces the passage: (**Gen 1:1**) In the beginning God created the heaven and the earth.

The formatting only effects the passage label **Gen 1:1** and its surrounding delimiters.

replace This key replaces `<find>` with `<repl>`. The syntax is,

```
replace={<find1>}{{<repl1>}}{<find2>}{{<repl2>}}...{<findk>}{{<replk>}}
```

where `<find1>` is replaced by `<repl1>`, and `<find2>` is replaced by `<repl2>`, and so on. Normally, `<find>` and `<repl>` are strings, but they can be commands as well, if done correctly.

```
217 \% \define@key{fbpes}{replace}[]{\fp@cntArgs#1\stop@rg
218 \%   \def\fbpes@replace{\#1}
219 \define@key{fbpes}{replace}[]{\% \fp@cntArgs#1\stop@rg
220   \ifx\fbpes@replace\empty\def\fbpes@replace{\#1}\else % dps13
221     \expandafter\def\expandafter\fbpes@replace
222     \expandafter{\fbpes@replace\#1}\fi
223     \expandafter\fp@cntArgs\fbpes@replace\stop@rg
224 }
225 \let\stop@rg\relax\def\st@p@arg{\stop@rg}%
```

Count the number of arguments to see if there are an even number of them.

```
226 \def\fp@cntArgs#1\stop@rg{\bgroup\@tempcpta\z@
227   \fp@cntArgs@i#1\stop@rg}
228 \def\fp@cntArgs@i#1{\def\arg@i{\#1}%

238   \def\fb@next{\fp@cntArgs@i}%
```

```

239      \fi\fb@next
240 }
241 \let\fbpes@replace\@empty
242 \let\repl@cep@ssage\@empty
243 \newif\iffb@silentreplace \fb@silentreplacefalse
(2016/12/17) Added switch to detect when a find is successful.
244 \newif\iffb@doreplace \fb@doreplacefalse
\isstopreplace determines whether #1 contains the stop marker \stoprepl@ce;
it \lets \stoprepl@cehere to 1 and to 0 otherwise.
245 \def\isstopreplace#1{\istopreplacei#1\stoprepl@ce\@nil}
246 \def\istopreplacei#1\stoprepl@ce#2\@nil{\def\fb@rgi{#1}\def\fb@rgii{#2}%
247   \ifx\fb@rgii\@empty\let\stoprepl@cehere\fb@Zero\else
248     \let\stoprepl@cehere\fb@One\fi}

```

\gobbleto defines a command (#2) that gobbles all content from the beginning of #2 to #1, inclusive. Used with `replace` when the find key has active characters, we'll just gobble past them.

```
249 \def\gobbleto#1#2{\def#2##1#1{}}
```

Replace algorithm. The following code is taken from another (unknown) source and modified considerably.

```

250 \def\fb@replace{\ifstar{\fb@silentreplacetrue\fb@replace@i} %
251   {\fb@silentreplacefalse\fb@replace@i}}
252 \def\fb@replace@i#1#2#3{\let\repl@cep@ssage\@empty
253   \global\fb@doreplacefalse
254   \iffb@silentreplace
255     \def\fb@gettoNext##1#2{\isstopreplace{##1}%
256       \ifx\stoprepl@cehere1\relax
257         \expandafter\g@addto@macro\expandafter
258           \repl@cep@ssage\expandafter{\fb@rgi}%
259         \def\fb@next{\let\fb@passage\repl@cep@ssage}%
260       \else

```

For silent mode, replacement occurs here, we mark it by setting \iffb@doreplace to true.

```

261     \global\fb@doreplacetrue
262     \def\fb@next{\g@addto@macro\repl@cep@ssage{##1#3}%
263       \fb@gettoNext}\fi
264   \fb@next}%
265 \else

```

This is where replacement occurs, we mark it by setting \iffb@doreplace to true.

```

266   \def\fb@gettoNext##1#2{##1#3\fb@gettoNext}%
267   \fi
268   \expandafter\fb@gettoNext#1\stoprepl@ce#2}
269 \def\stoprepl@ce#1\fb@gettoNext{}%

```

Example The passage Mat 2:1 ends with a comma, to change this to a period, we would use `replace`. In the passage, there are several commas, we want to replace the one following Jerusalem.

```
\fetchverse[replace={Jerusalem,}{Jerusalem.}]{Mat 2:1}
```

(Mat 2:1) Now when Jesus was born in Bethlehem of Judaea in the days of Herod the king, behold, there came wise men from the east to Jerusalem.

pcolor The value of `color` colors the text.

```
270 \define@key{fbpes}{pcolor}[]{\def\fbp@pcolor{-#1}}
271 \let\fbp@pcolor\empty
```

pformat The value of `pformat` passes formatting declarations to the text.

```
272 \define@key{fbpes}{pformat}[]{\def\fbp@pformat{-#1}}
273 \let\fbp@pformat\empty
```

caps With the `caps`, you can make the display the chapter name in capital letters ‘GENESIS’ versus ‘Genesis’.

```
274 \define@boolkey{fbpes}{caps}[true]{\ifKV@fbpes@caps
275   \def\fbpes@case{\uppercase}\else
276   \let\fbpes@case\empty\fi
277 }
278 \let\fbpes@case\empty
```

Example We capitalize the full book name:

```
\fetchverse[format=\bfseries\sffamily,abbr=none,caps]{Gen 1:1}
```

(GENESIS 1:1) In the beginning God created the heaven and the earth.

showfirst The `showfirst` key is a Boolean, which if true, the first verse number is typeset. The default is false, the first verse number is not typeset.

```
279 \define@boolkey{fbpes}{showfirst}[true]{}
280 \KV@fbpes@showfirstfalse
```

Examples We compare the passages `Gen 1:1-2` with and without first verse number: `\fetchverses[showfirst]{Gen 1:1-2}` versus `\fetchverses{Gen 1:1-2}`.

- ¹In the beginning God created the heaven and the earth. ²And the earth was without form, and void; and darkness was upon the face of the deep. And the Spirit of God moved upon the face of the waters.

- In the beginning God created the heaven and the earth. ²And the earth was without form, and void; and darkness was upon the face of the deep. And the Spirit of God moved upon the face of the waters.

shownone When `shownone` is specified, no verses numbers are shown in the specified passage. When `shownone` is specified, the related option `showfirst` has no effect.

```
281 \define@key{fbpes}{shownone}[]{\let\verseFmt\gobble}
```

Example

```
\fetchverses[shownone,enclosewith=\quote]{Gen 1:1-3}
```

“In the beginning God created the heaven and the earth. And the earth was without form, and void; and darkness was upon the face of the deep. And the Spirit of God moved upon the face of the waters. And God said, Let there be light: and there was light.”

- useperiod** The **useperiod** key is a Boolean, which if true a period follows any abbreviation of a book name. If **useperiod=false** no period is affixed. The default is true. (‘Matt.’ versus ‘Matt’, for example.)

```
282 \define@boolkey{fbpes}{useperiod}[true]{%
283   \ifKV@fbpes@useperiod\def\fbp@period{.}\else\def\fbp@period{}\fi
284 }
285 \def\fbp@period{.}
286 \KV@fbpes@useperiodtrue
```

Examples

- `\fetchverse[abbr=long]{Mat 2:1}`: (Matt. 2:1) Now when Jesus was born in Bethlehem of Judaea in the days of Herod the king, behold, there came wise men from the east to Jerusalem,
- `\fetchverse[abbr=long,useperiod=false]{Mat 2:1}`: (Matt 2:1) Now when Jesus was born in Bethlehem of Judaea in the days of Herod the king, behold, there came wise men from the east to Jerusalem,

The period is used by default, you must say **useperiod=false** to remove it.

- citeatend** The **citeatend** key is a Boolean, which if true, places the citation reference at the end of the passage.

```
287 \define@boolkey{fbpes}{citeatend}[true]{}
```

Example `\fetchverses*[citeatend,showfirst]{Gen 1:1-2}` displays as:

¹In the beginning God created the heaven and the earth. ²And the earth was without form, and void; and darkness was upon the face of the deep. And the Spirit of God moved upon the face of the waters. (Gen 1:1-2)

- nocite** For the `\fetchverse` command only, if **nocite** is present, the citation not to appear.

```
288 \define@boolkey{fbpes}{nocite}[true]{}
```

Example `\fetchverse[nocite]{Gen 1:1}` displays as:

In the beginning God created the heaven and the earth.

Of course, the default is to cite the reference.

- priorref** The value of **priorref** is placed as the command `\fbpes@priorref` just before the book reference (`\fbpes@priorref{\book@passage}`). The book reference itself

(\book@passage) is enclosed in braces so \fbpes@priorref can be a macro with one argument.

```
289 \define@key{fbpes}{priorref}{\long\def\fbpes@priorref{\#1}}
290 \let\fbpes@priorref\relax
```

Example Place the passage reference in the margin. The command \mpfmt is defined locally, within the quote environment.

Gen 1:1-2 In the beginning God created the heaven and the earth. ²And the earth was without form, and void; and darkness was upon the face of the deep. And the Spirit of God moved upon the face of the waters.

The definition of \mpfmt within the quote environment is

```
\def\mpfmt#1{\afterRef{}\marginpar{\small\raggedleft#1}}
```

The \afterRef command is described later in this documentation.

localdefs To pass local commands that do not disturb the command expansions or take up space, use the **localdefs** key.

```
291 \define@key{fbpes}{localdefs}[]{\def\fbpes@localdefs{\#1}}
292 \let\fbpes@localdefs\empty
```

See the demo file `bibpes_replaces.tex` for an example.

typeset=*opts* The **typeset** key is used with \fetchversesstxt. If true, we assume the \passagetxt command is meant to be typeset and, as a result, the normal behavior of \fetchverses is followed; if false, certain special definitions are activated that allow \passagetxt to pass to another macro, such as \pdfcomment. This option is ignored within the optional list of \fetchverses.

Added a value to the key **typeset**, which was a boolean key. Now, it is a combination, both a Boolean and a regular key.

- If \if@versetxt is true, the value (*opts*) of **typeset** is ignored
- If \if@versetxt is false, the value of **typeset** (*opts*)/\fbpes@typeset is included at the end of the option list.

```
293 \newif\ifKV@fbpes@typeset\KV@fbpes@typesettrue
294 \define@key{fbpes}{typeset}[]{\KV@fbpes@typesettrue
295   \def\fbpes@typeset{\#1}\let\fbpes@typeset\empty}
```

typeset*=*opts* The **typeset*** option is the same as **typeset**, but does not set the switch to \KV@fbpes@typesettrue.

```
296 \define@key{fbpes}{typeset*}[]{%
297   \def\fbpes@typeset{\#1}\let\fbpes@typeset\empty}
```

This ends the section on the key-values of the \fetchverse and \fetchverses commands.

2.5 Main command definitions

2.5.1 Formatting commands for fetch commands

\priorRefSpc This command sets the spacing prior to the reference, only applicable when citeatend=true.

```
298 \long\def\priorRefSpc#1{\def\fbp@priorRefSpc{#1}}
299 \def\fbp@priorRefSpc{\space}
```

\fbFitItIn is designed to be used as the argument of \priorRefSpc. Another suggest style is \fbFillRght.

```
300 \def\fbFitItIn{\noindent\unskip\nobreak\hfill\penalty100
301     \hskip1em\hbox{}{\nobreak\hfill}}%
302 \def\fbFillRght{\hfil\break\null\hfil}
```

Examples

```
\fetchverses*{Gen 1:1-2} (the default)
```

¹In the beginning God created the heaven and the earth. ²And the earth was without form, and void; and darkness was upon the face of the deep. And the Spirit of God moved upon the face of the waters. (Gen 1:1-2)

```
\priorRefSpc{\fbFillRght}\fetchverses*{Gen 1:1-3}
```

¹In the beginning God created the heaven and the earth. ²And the earth was without form, and void; and darkness was upon the face of the deep. And the Spirit of God moved upon the face of the waters. ³And God said, Let there be light: and there was light.

(Gen 1:1-3)

```
\priorRefSpc{\fbFitItIn}\afterBookSpc{\nobreak\ }%
\fetchverses*{Gen 1:1-3}
```

¹In the beginning God created the heaven and the earth. ²And the earth was without form, and void; and darkness was upon the face of the deep. And the Spirit of God moved upon the face of the waters. ³And God said, Let there be light: and there was light.

(Gen 1:1-3)

\useBookStyle \useBookStyle sets the option keys just defined above. This command may be used in the body of the document to change the style.

```
303 \newtoks\fetchtoks \% dps13
```

The translation note is not shown unless the transl key has a specified value. We provide a method of showing the translation note, even if transl is not present.

\showTranslAlways turns on the feature of showing the translation note; whereas \showTranslDecld reverts the system back to its default, show translation note only if transl has a value.

```
304 \newif\ifshowDefBible \showDefBiblefalse
305 \def\showTranslAlways{\showDefBibletrue}
306 \let\AlwaysShowDefBible\showTranslAlways
307 \def\showTranslDecld{\showDefBiblefalse}
308 \let\NeverShowDefBible\showTranslDecld
```

```

309 \newif\if@versetxt@\versetxtfalse
310 \def\useBookStyle{\def\fp@SK{\setkeys{fbpes}}\expandafter
311   \fp@SK\expandafter{\#1}\if@versetxt\else
312     \ifx\fbpes@typeset@\empty\else

```

If `\fbpes@typeset` is nonempty and `\if@versetxt` is false, we combine any key-values passed to us through the `typeset` option.

```

313   \fetchtoks=\#1,\edef\x{\the\fetchtoks}%
314   \fetchtoks=\expandafter\expandafter
315     \expandafter{\expandafter\x\fbpes@typeset}%
316   \let\fbpes@replace\empty

```

And, read again this new set of options.

```

317   \edef\x{\the\fetchtoks}\expandafter
318   \fp@SK\expandafter{\x}%
319   \fi
320   \fi
321 }
322 \useBookStyle{abbr,roman=false,from,transl}
323 \def\ioiv#1#2#3#4{\#1}\def\iioiv#1#2#3#4{\fbpes@case{\#2}}
324 \def\iiioiv#1#2#3#4{\fbpes@case{\#3}}\def\ivoiv#1#2#3#4{\fbpes@case{\#4}}

```

Example

```

\useBookStyle{abbr=none,roman}
\fetchverse{1Co 1:1}

```

(I Cor. 1:1) Paul, called to be an apostle of Jesus Christ through the will of God, and Sosthenes our brother,

`\fb@bksp` `\fb@bksp` is the space that occurs just after the display of the book. The command declaration `\afterBookSpc` is a convenience command for changing `\fb@bksp`. The command `\resetAfterBookSpc` resets `\fb@bksp` to its default.

```

325 \def\afterBookSpc{\def\fb@bksp{\#1}}
326 \def\resetAfterBookSpc{\afterBookSpc{}}
327 \def\fb@bksp{\ }

```

Example We declare `\afterBookSpc{}`, which removes the space between the book and passage reference:

(Gen1:1) In the beginning God created the heaven and the earth.

There may be some application to this.

`\afterRef` `\afterRef` is the space that follows the passage reference. Declaring `\afterRef{}` is equivalent to setting the space after the reference to `\space`.

```

328 \long\def\afterRef{\def\@rgi{\#1}\ifx\@rgi\empty
329   \def\@fterRef{\space}\else
330   \def\@fterRef{\#1}\fi}
331 \afterRef{}

```

Example We declare \afterRef{\qquad}, which sets the space after the passage reference to \qquad:

(Gen 1:1) In the beginning God created the heaven and the earth.

\@nmsspc \@nmsspc is the space between the book number and the book, if there is a book number. (E.g., 1 Corinthians). We also supply a convenience command of \afterNumSpc.

```
332 \def\afterNumSpc#1{\def\@nmsspc{#1}}
333 \def\@nmsspc{\space}
```

Example Remove the space and use roman numbers:

```
\afterNumSpc{} \fetchverse[abbr=long,roman]{1Co 1:1}
```

(ICor. 1:1) Paul, called to be an apostle of Jesus Christ through the will of God, and Sosthenes our brother,

\setNumStyle is an internal macro that uses the commands defined by the roman key and the \@nmsspc command.

```
334 \def\setNumStyle{\def\1{\fb@numi \@nmsspc}\def\2{\fb@numii \@nmsspc}%
335 \def\3{\fb@numiii \@nmsspc}}
```

2.5.2 Parsing commands for fetch commands

The argument of \fb@fmtBook is \bib@book, the three-letter name of the book. We expand \@nameuse{bkfmt#1}, which expands to ‘{}-{}-{}-{}’, the four tokens that are the alternate representations of the book defined by \bookFmt above.

```
336 \newif\ifbookexists \bookexiststrue
337 \def\fb@fmtBook#1{\edef\fb@fmtBookExp{\noexpand
338 \fbpes@abbr\@nameuse{bkfmt#1}}\fb@fmtBookExp}
```

The \fb@getBookAPassage command parses the second argument of \fetchverse and \fetchverses to break it down into book, chapter, and verses.

```
339 \def\fb@getBookAPassage#1 #2@nil{\def\bib@book{#1}\def\bib@passage{#2}%
```

Adjust the formatting of the book by removing spurious spaces. Then, see if the book has more than three letters (e-Sword uses only three).

```
340 \ifparsefetcharg\adjbib@passage{iffalse}\fi\fb@doInvLUAsNeeded#1@nil
341 }
```

The argument of \adjbib@passage is #1 = `{iftrue|iffalse}`, if true then the start and end calculations are made in \fb@get@verses. The effects of this command (when ifffalse is passed) is to remove any spurious spaces from the passage, eg. {Joh 3:27 - 30} becomes {Joh 3:27-30} and {Joh 3:27 - } becomes {Joh 3:27-}.

```
342 \def\adjbib@passage#1{\edef\@tempexp{\noexpand
343 \fb@get@chptverse{#1}}\expandafter\@tempexp\bib@passage\@nil}%
```

\fb@doInvLUAsNeeded takes the book name (normally three tokens), if more than three, we assume it is the full name and convert it to the e-Sword abbreviation.

```

344 \def\fb@doInvLUAsNeeded#1#2#3#4@nil{\def\@rg{#4}%
345   \ifx\@rg\empty
346     @ifundefined{bkfmt#1#2#3}\bookexistsfalse\bookexiststrue

```

```
382  \fi
```

```
383 }
```

2.5.3 The `\fetchverse` command

`\fetchverse` The `\fetchverse` fetches a *single* Bible verse referenced by #1. For example, if we type `\fetchverse{Mat 2:1}`, the result is shown below.

(Mat 2:1) Now when Jesus was born in Bethlehem of Judaea in the days of Herod the king, behold, there came wise men from the east to Jerusalem,

`\fb@fetchverse` The result is the Bible reference followed by the corresponding Bible verse (or passage). The format for the reference is determined by the `\fb@fetchverse` command. When the version is not defined, the expression ‘`??(#1)??`’ is typeset; for example, ‘`??(Mat 2:11)??`’. In this case, you must use `bibpes` to define the needed passage. The syntax for `\fetchverse` is,

```
\fetchverse[opts]{3ltrbk\ch:vrs} or
\fetchverse[opts]{fullbk\ch:vrs}
```

In the second case, `fullbk` is the full book name, it must be one of the books listed as the second argument of the `\fb@inv@name` commands. See Section 2.9 for the listing.

```

477     \fi
478 }

```

2.5.4 The \fetchverses and \fetchverses* commands

\fetchverses fetches the verse or verses only, it does not typeset the reference (such as '(Mat 2:1)'). The syntax of the argument is as follows:

```
\fetchverses{Mat 2:1} or \fetchverses{Mat 2:1-10}
```

in the latter case, verses 1 through 10 are fetched. Note that you can specify a range of verses within the same chapter, *but not across chapters*. Though \fetchverses does not typeset the reference, but the \fetchverses* variation does. Thus \fetchverses*{Mat 2:1} typesets the passage: (Mat 2:1) Now when Jesus was born in Bethlehem of Judaea in the days of Herod the king, behold, there came wise men from the east to Jerusalem,

The syntax for \fetchverses and its *-variation is,

```
\fetchverse[<opts>]{<book>:<ch>:<vrs>}
\fetchverses*[<opts>]{<book>:<ch>:<vrs>} or
\fetchverses*[<opts>]{<book>:<ch>:<vrs1>-<vrs2>} or
\fetchverses*[<opts>]{<book>:<ch>:-<vrs1>}
```

The last one indicates that we should pull all verses until the end of the chapter, or until we have not more verses defined.

```
479 \newcommand{\fetchverses}{\bgroup\setNumStyle
480   @ifstar{\let\isitstar\fb@One\fb@fetchversesi}
481   {\let\isitstar\fb@Zero\fb@fetchversesi}}
```

\fetchversestxt Retrieve the verse in question, but without formatting of any kind. We return the result in the macros \versetxt and \passagetxt; \fetchversestxt does not have an '*' option. Its syntax is the same as above, but with no *-option.

```
482 \newcommand{\fetchversestxt}[2][]{\bgroup
483   @versetxttrue\KV@fbpes@typesetfalse
484   \global\let\passagetxt@\empty
485   \fetchverses[#1]{#2}\egroup
486 }
```

We \let \fetchversetxt to \fetchversestxt in case doc author fails type it correctly.

```
487 \let\fetchversetxt\fetchversestxt
```

We continue \fetchverses by getting the arguments and parsing them.

```
488 \newcommand{\fb@fetchversesi}[2][]{\def\@rgi{\#1}\def\passagespec{\#2}%
489   \ifx\@rgi\empty\else\useBookStyle{\#1}\ifx\fbpes@altstar\empty\else
490     \ifx\fbpes@alt\empty\else\PackageWarning{fetchbibpes}%
491     {You have specified both alt* and alt,\MessageBreak
492     removing the alt key}\fi\fi\fi
```

If this is not the \fetchversestxt command, we are going to typeset results.

```
493 \if@versetxt\else\KV@fbpes@typesettrue\fi
494 \ifKV@fbpes@typeset\else
```

The only way we expand this following code is if `\fetchverses` is in play, but the `typeset` option is not taken. Because this is not designed to be typeset, we don't use superscripts.

```
495     \def\verseFmt##1{\space}\def\fb@bksp{\space}%

```

Also, all quotes are literal, no special processing, no active characters.

```
496     \def\h@ndledq{"}\def\h@ndlesq{'}\def\bH@ndlelxQs{'}%

```

```
497 \fi

```

```
498 \let.\fbp@period\fbpes@localdefs

```

```
499 \fb@getBookAPassage#2@nil\fb@fetchversesii#2@nil}
```

Continuing, we build `\book@passage` and cycle through all requested verses, retrieving them as we go.

```
500 \def\fb@insrtvnf\ifnum@tempcnta=\fb@verseStart\relax

```

```
501 \ifKV@fbpes@showfirst\verseFmt{\the\@tempcnta}\fi

```

```
502 \else\space\verseFmt{\the\@tempcnta}\fi

```

```
\translTxtFmt{\fmt-transl-#1}
```

Defines an internal text macro with one argument (#1), this argument is the translation text macro `\fbpes@transl`. Its expansion is delayed. This command affects `\feachverses`. The initial declaration is `\translTxtFmt{\space #1}`, but the document author can change it for whatever purposes. Return to this default declaration by expanding `\translTxtFmtDef`. The initial declaration and default is `\translTxtFmt{\space #1}`.

```
503 \def\translTxtFmt#1{%

```

```

\cobblevrs*((\cmd){\text}) For users of \fetchversestxt, \cobblevrs ‘cobbles’ verses together. \cobblevrs takes text and adds it onto the end of the macro \cmd. The star-version first \lets \cmd to \empty. If \cmd is undefined, it is first set to \empty.

This is a general purpose macro, not restricted to use by \fetchversestxt. For example,
```

```

\fetchversestxt[typeset,abbr=none,from*=KJV]{Gen 1:1}\cobblevrs*\holdverses
 {(\versetxt)\space\passagetxt}
\fetchversestxt[typeset,abbr=none,from=ISV,transl=ISV]{Gen 1:1}\cobblevrs
 \holdverses{ Now, the same quote from ISV: (\versetxt)\space\passagetxt}
\fetchversestxt[typeset,abbr=none,from*=YLT]{Gen 1:1}\cobblevrs\holdverses
 { Again, but now from YLT: (\versetxt)\space\passagetxt}\holdverses

```

yields

(Genesis 1:1 KJV) In the beginning God created the heaven and the earth. Now, the same quote from ISV: (Genesis 1:1 ISV) In the beginning, God created the universe. Again, but now from YLT: (Genesis 1:1 YLT) In the beginning God created the heaven and the earth.

```

659 \newcommand{\cobblevrs}{\@ifstar{\cobblevrs@i}{\cobblevrs@ii}}
660 \def\cobblevrs@i#1{\let#1\empty\cobblevrs@ii{#1}}
661 \def\cobblevrs@ii#1#2{\ifx#1\undefined\let#1\empty\fi
662   \bgroup
663   \toks0=\expandafter{#1}\toks2=\expandafter{#2}%
664   \set@typeset@protect

```

```

665     \protected@edef\fb@xtmp{\the\toks0 \the\toks2 }%
666     \protected@xdef#1{\fb@xtmp}%
667     \egroup
668 }

```

2.5.5 Formatting the verse numbers

We define three commands to support the formatting of the verse numbers. `\verseFmtDef` is the default formatting (verse number as a superscript); while `\verseFmt` formats the verse number, it takes one argument, which turns out to be the verse number; the command may be redefined. After redefinition, if you want to return to the default definition, just `\verseFmtReset`. Of course, `\verseFmtDef` may be redefined to have a different default definition.

```

669 \newcommand{\verseFmtDef}[1]{\ensuremath{{}^{\text{\scriptsize{fb@sc{#1}}}}}}
670 \newcommand{\verseFmt}[1]{\verseFmtDef{#1}}
671 \newcommand{\verseFmtReset}{\def\verseFmt##1{\verseFmtDef{##1}}}

```

Below are verses showing the default representation of the verse numbers.

(Genesis 1:1-5) ¹In the beginning God created the heaven and the earth.
²And the earth was without form, and void; and darkness was upon the face of the deep. And the Spirit of God moved upon the face of the waters. ³And God said, Let there be light: and there was light. ⁴And God saw the light, that it was good: and God divided the light from the darkness. ⁵And God called the light Day, and the darkness he called Night. And the evening and the morning were the first day.

However, this formatting can be redefined to obtain the style of numbers you want. In the passage that follows, I've changed the formatting style seen in some Bibles of the multiple passages.

GENESIS 1:1-5

- 1 In the beginning God created the heaven and the earth.
- 2 And the earth was without form, and void; and darkness was upon the face of the deep. And the Spirit of God moved upon the face of the waters.
- 3 And God said, Let there be light: and there was light.
- 4 And God saw the light, that it was good: and God divided the light from the darkness.
- 5 And God called the light Day, and the darkness he called Night. And the evening and the morning were the first day.

Now we switch back to the default presentation style, we make command declarations `\afterRef{} \verseFmtReset`.

See the demo file `bibpes_tst.tex` to see the source for the above passages.

We also define `\@afterVerseFmt` that is initially set to `\@gobble`. The command is placed immediately after `\verseFmt` and may conveniently redefined using `\afterVerseFmt`. The command is used primarily to place notes in the margin of a Bible passage. `\afterVerseFmt` is a convenience command for setting

`\afterVerseFmt`

```

\@fterVerseFmt.

672 \let\@fterVerseFmt\@obble
673 \def\afterVerseFmt#1{\def\@rgi{#1}\ifx\@rgi\@empty
674     \let\@fterVerseFmt\@obble\else\def\@fterVerseFmt{#1}\fi}

Some utility commands.

675 \@ifundefined{text}{\def\fb@sc#1{\mbox{\scriptsize #1}}}
676     {\def\fb@sc#1{\text{#1}}}

```

2.5.6 Dealing with *Strong's Concordance*

When the KJV+ is used, for example, the text is annotated with cross-references to *Strong's Concordance*. In the text file, the references are of the form ‘G|H\d+’, where \d+ means one or more natural numbers, ‘G’ and ‘H’ refer to the Greek and Hebrew scriptural texts. The references come through in the TXT files as ‘G3739’ or ‘H7225’. When using the WinEdt editor, you can use a regular expression find and replace these references with command versions (e.g., \G{3739} or \H{7225}):

Greek Strong	Hebrew Strong
find: G\(+\$Numeric\\$)	find: H\(+\$Numeric\\$)
replace: \\G{\0}	replace: \\H{\0}

Macro File
Procedure

This can be done in either the TXT or DEF file. If you are using WinEdt, you can use the specially written Macro File `bibpes_strongs.edt`. Open the TXT or DEF file (DEF preferred) in WinEdt. The procedure for using this Macro File is as follows: (1) Use the menu `Macro > Execute Macro Script`, browse for `bibpes_strongs.edt` and select it; (2) the Find and Replace dialog box opens with various fields pre-filled; (3) Press ‘Replace All’, and the regular expression find and replace looks for expressions of the form `Gnnnn` or `Hnnnn`, and replaces them with `\G{nnnn}` and `\H{nnnn}`. The definitions of `\G` and `\H` follow; they may be redefined.

```

677 \def\G#1{${}^{\sim}\{\fb@sc{G#1}\}{}$}
678 \def\H#1{${}^{\sim}\{\fb@sc{H#1}\}{}$}

```

2.5.7 Miscellaneous Commands

```

679 \def\fb@gobtonil#1\@nil{ }
680 \def\fb@gettonil#1\@nil{\def\to@nilarg{#1}}
681 \def\fb@ifspc{\ifx\@let@token\@sptoken
682     \let\fb@next\fb@xifspc\else
683     \let\fb@next\fb@gettonil\fi\fb@next}
684 \begingroup
685 \def\:{\fb@xifspc}
686 \expandafter\gdef\:{\futurelet\@let@token\fb@ifspc}
687 \endgroup
688 \def\fb@strpspc{\futurelet\@let@token\fb@ifspc}
689 \def\fb@rmvspcsp#1{\expandafter\fb@strpspc#1\@nil\edef#1{\to@nilarg}}

```

\letEach...\\to is a convenience command to \let several commands to another command, usually \relax. For example,

```
\letEach\cmdi\cmdii\cmdiii\to\relax
```

is equivalent to `\let\cmdi\relax\let\cmdii\relax\let\cmdiii\relax`. See the sample file `bibples_replaced.tex` for an example of application.

```
690 \def\letEach#1\to#2{\@tfor\@tmp:=#1\do{\expandafter\let\@tmp=#2}}
```

2.6 Environment for longer quotes

`LATeX` has three environments for quoting long passages, these are `quote`, `verse`, and `quotation`. In this package, we define three environments based on these `fpquote`, `fpverse`, and `fpquotation`. We include an optional argument for each of the environments for setting the `\leftmargin`, `\rightmargin`, and `\itemindent`. Use the keys `leftmargin`, `rightmargin`, and `itemindent` to do this.

```
691 \define@key{fp@qts}{leftmargin}[\leftmargin]{\def\fp@qts@leftmargin{#1}}
692 \def\fp@qts@leftmargin{\leftmargin}
693 \define@key{fp@qts}{rightmargin}[\leftmargin]{%
694   \def\fp@qts@rightmargin{#1}}
695 \def\fp@qts@rightmargin{\leftmargin}
696 \define@key{fp@qts}{itemindent}[1.5em]{\def\fp@qts@itemindent{#1}}
697 \def\fp@qts@itemindent{1.5em}
698 \newenvironment{fpquote}[1][]{%
699   \setkeys{fp@qts}{#1}\list{}{%
700     \setlength{\leftmargin}{\fp@qts@leftmargin}%
701     \setlength{\rightmargin}{\fp@qts@rightmargin}%
702     \item\relax}
703   \endlist}
704 \newenvironment{fpverse}[1][]{%
705   \let\\@centercr\setkeys{fp@qts}{#1}%
706   \list{}{\itemsep \z@%
707     \itemindent -\fp@qts@itemindent\relax
708     \listparindent\itemindent
709     \setlength{\leftmargin}{\fp@qts@leftmargin}%
710     \setlength{\rightmargin}{\fp@qts@rightmargin}%
711     \advance\leftmargin \fp@qts@itemindent\relax}%
712   \item\relax}
713 \endlist}
714 \newenvironment{fpquotation}[1][]{%
715   \setkeys{fp@qts}{#1}\list{}{\listparindent \fp@qts@itemindent\relax
716     \itemindent \listparindent
717     \setlength{\leftmargin}{\fp@qts@leftmargin}%
718     \setlength{\rightmargin}{\fp@qts@rightmargin}%
719     \parsep \z@ \oplus\p@}%
720   \item\relax}
721 \endlist}
```

2.7 Marginal notes

We devise a scheme for placing notes in the margin for individual notes on the margins.

\fb@bibnoteshold holds the notes (comments) for the selected passage.

722 \let\fb@bibnoteshold\empty

\verseCmts The \verseCmts command is used to define the notes (comments) as a function of the verse number. For example, the following declaration is used in the example below.

```
\verseCmts{%
    {In the beginning God creates\ldots}      % v1
    {Earth void}                            % v2
    {Light!}                                % v3
    {}                                     % v4
    {First day}                            % v5
}
```

Its argument is a series of token (comments enclosed in braces), the first token is the comment for verse 1, then verse 2, and so on. All verse must have a comment, even an empty comment.

723 \def\verseCmts#1{\def\@rg{\ifx\@rg\empty
724 \let\fb@bibnoteshold\empty\let\fb@next\relax\else
725 \def\fb@next{\verseCmtsi{#1}}\fi\fb@next}
726 \def\verseCmtsi#1{\@tfor\bib:=#1\do{%
727 \g@addto@macro\fb@bibnoteshold{\or}%
728 \expandafter\g@addto@macro\expandafter
729 \fb@bibnoteshold\expandafter
730 {\expandafter\fb@mpbib\expandafter{\bib}}%
731 } \g@addto@macro\fb@bibnoteshold{\fi}%
732 }}

\fbMarParFmt may be redefined by the document author. It determines how the Bible notes are to appear in the margin. The argument #1 is the note to be displayed in the margin.

733 \newcommand\fb@DefaultMarParFmt[1]{\marginpar{\footnotesize\raggedright
734 \verseFmt{\vrseNum}{#1}}
735 \newcommand{\fbMarParFmt}[1]{\fb@DefaultMarParFmt{#1}}
736 \newcommand{\fbResetMarParFmt}{%
737 \gdef\fbMarParFmt##1{\fb@DefaultMarParFmt{##1}}}
\fb@mpbib is inserted into \fb@bibnoteshold by \verseCmtsi.

738 \def\fb@mpbib#1{\def\@rg{\ifx\@rg\empty\else
739 \fbMarParFmt{#1}\fi}#1}

Now to make this all work, you need to expand \afterVerseFmt{\fb@cmtV}; However, two helper commands may be used, these are \fbMarNotesOn and \fbMarNotesOff. The former to turn on marginal notes, the latter to turn them off again. \fb@cmtV is placed just after \verseFmt.

```

740 \newcommand\fbMarNotesOn{\afterVerseFmt{\fb@cmtV}}
741 \newcommand\fbMarNotesOff{\afterVerseFmt{}}

It is \fb@cmtV that selects the correct note for the current verse. It uses
\fb@bibnoteshold. If \fb@bibnoteshold is empty, the command does nothing.

742 \def\fb@cmtV{\ifx\fb@bibnoteshold\empty\expandafter\gobble\else
743   \expandafter\fb@cmtVi\fi}
744 \def\fb@cmtVi#1{\def\vrseNum{#1}%
745   \def\fb@bifcase{\ifcase#1}\expandafter\fb@bifcase\fb@bibnoteshold}

```

Example

GENESIS 1:1-5

¹In the beginning God created the heaven and the earth.

¹In the beginning God
creates...

²And the earth was without form, and void; and darkness
was upon the face of the deep. And the Spirit of God moved
upon the face of the waters.

³Light!

³And God said, Let there be light: and there was light.

⁴And God saw the light, that it was good: and God divided the light from the darkness.

⁵First day

⁵And God called the light Day, and the darkness he called
Night. And the evening and the morning were the first day.

After this passage, we turn everything off with \fbMarNotesOff\verseCmts{}.

2.8 Fixing the double quote

We have a problem with the double quote ("), used by e-Sword. We develop a simple solution. We make ‘“’ an active character, and have a running count going (\dqcnt), if \dqcnt is odd we typeset ‘’, else we typeset ‘‘’. This may work if the fetched verses always contain a complete matched pair of double quotes, with no nested double quotes.

```

746 \newcount\fp@dqcnt \fp@dqcnt=0
(2016/04/11) Added single quote counter
747 \newcount\fp@sqcnt \fp@sqcnt=0
Define left and right, single and double quotes for later use.
748 \def\fp@lq{'}\def\fp@rq{''}\def\fp@lqq{''}\def\fp@rqq{''}
(2016/04/11) Advance \fp@dqcnt and \fp@sqcnt globally
749 \def\h@ndledq{\ifodd\fp@dqcnt\expandafter\fp@rqq\else
750   \expandafter\fp@lqq\fi\global\advance\fp@dqcnt\@ne}
751 \def\h@ndlesq{\ifodd\fp@sqcnt\fp@rq\else\fp@lq\fi
752   \global\advance\fp@sqcnt\@ne}
(2016/09/14) Changes in quote handling routines to allow for latex markup for
quotes.

```

The active left single quote comes here, we see what the next token is, and continue at \bQsCont@fp.

```
753 \def\bH@ndleltxQs{\futurelet\fp@next\bQsCont@fp}
```

Single quote followed by another single quote, we \@gobble the next one up and replace them with \fp@lqq.

```
754 \def\bH@ndleltxDQ{\fp@lqq\@gobble}
```

If its a latex single left quote, we replace it with \fp@lq.

```
755 \def\bH@ndleltxSQ{\fp@lq}
```

If author is using L^AT_EX quotes, the flow comes here, we test to see if this is a double left quote or not. Continue at \eQsCont@fp.

```
756 \def\eH@ndleltxQs{\futurelet\fp@next\eQsCont@fp}
```

Yes, a double latex right quote.

```
757 \def\fp@rq{\@gobble}
```

```
758 \def\fp@rq{\fp@rq}
```

Modified \fp@rq@choice to expand in mouth

```
759 \def\fp@rq@choice{\ifNotL@TeXQuotes
```

```
760     \expandafter\h@ndlesq\else
```

```
761     \expandafter\@H@ndleltxQs\fi
```

```
762 }
```

```
763 \begingroup\catcode`\"=\active \catcode`\'=\active \catcode`\'=\active
```

For L^AT_EX quoting system, we have two ‘intelligent’ commands. \bQsCont@fp tests whether the next token is a single left quote, if it is, flow goes to \bH@ndleltxDQ, otherwise, it goes to \bH@ndleltxSQ. Similarly for right quotes.

```
764 \gdef\bQsCont@fp{\ifx\fp@next`\expandafter\bH@ndleltxDQ\else
```

```
765     \expandafter\bH@ndleltxSQ\fi} % dps
```

```
766 \gdef\@QsCont@fp{\ifx\fp@next`\expandafter\@H@ndleltxDQ\else
```

```
767     \expandafter\@H@ndleltxSQ\fi} % dps
```

\cvrtdqs creates active characters and associates commands for handling them.

It is introduced through the \AddToVersesList command.

```
768 \gdef\cvrtdqs{%
```

Replace \let by \gdef, and \protect each command.

```
769     \expandafter\catcode`fp@lq`=\active\gdef"\{\protect\h@ndledq\}%
```

```
770     \expandafter\catcode`fp@lq`=\active\gdef'\{\protect\fp@rq@choice\}%
```

```
771     \expandafter\catcode`fp@lq`=\active\gdef'\{\protect\bH@ndleltxQs\}%
```

```
772 }
```

```
773 \endgroup
```

In the case of unbalanced double quotes, you can force the correct quote to appear by specifying \bDQ (left-quote) or \eDQ (right-quote).

```
\bDQ 774 \def\bDQ{\global\fp@dqc=0 }\def\bSQ{\global\fp@sqc=0 }
```

```
775 \def\@DQ{\global\fp@dqc=1 }\def\@SQ{\global\fp@sqc=1 }
```

```
776 \def\ckDQs@End{\ifodd\fp@dqc\PackageWarning{fetchbibpes}}
```

```
777     {An odd number of double quotes detected,\MessageBreak
```

```
778     please correct}\fi}
```

```
779 \AtEndDocument{\ckDQs@End}
```

\inputVerseList is a command that inputs the requested files.

```
780 \def\inputVerseList{\InputIfFileExists{\#1.def}}
```

```

781      {\PackageInfo{fetchbibpes}{Inputting #1.def}}
782      {\PackageInfo{fetchbibpes}{#1.def cannot be found}}%
783 }

```

2.9 Inverse name lookup

Some people like to type the full name of the chapter, we'll try to detect this, and convert to e-Sword abbreviations.

3 List of DEF to input

We develop a list of all requested DEF files, and input them at the beginning of the document. `\useverseslist` is a text macro that holds the list of commands `\inputVerseList{#1}`, there `#1` is the a DEF file that is added to the list. We define a convenience command `\@AddToVersesList` to aid the effort to make a list.

```

853 \let\useverseslist\empty
854 \newcommand{\@AddToVersesList}{\gaddto@macro\useverseslist}

```

We initialize the list by putting all we do in a group, and insert the code, `\cvrtdqs`, to make the corrections for the double quotes.

```

855 \@AddToVersesList{\begingroup\cvrtdqs}
856 \ifx\fbpes@useverses\empty\else
857   \edef\temp@expand{\noexpand\@for\noexpand\@@tmp:=\fbpes@useverses}
858   \temp@expand\do{%
859     \ifx\@@tmp\empty\else

```

Strip off any specious spaces

```

860           \fb@rmvspcsp{\@@tmp}%

```

Expand where needed and add to the list

```
861          \edef\tmp@expandverse{\noexpand
862              \inputVerseList{\fb@deffolder\@@tmp}%
863              \expandafter\@AddToVersesList\expandafter{\tmp@expandverse}%
864          \fi
865      }%
866 \fi
867 \@AddToVersesList{\endgroup}
868 \def\selectedVersesFrom#1{\PackageWarning{fetchbibpes}
869     {\string\selectedVersesFrom\space requires the\MessageBreak
870      useselverses option. Gobbling up\MessageBreak your argument}}
```

4 Input the configuration file

If `ignorecfg` is not specified in the option list of `fetchbibpes`, a configuration file is input at this point. The name of the configuration is set by the value of the `cfg` key; `fbpes.cfg` is input if `cfg` is not specified.

```
871 \iffb@ignorecfg
872     \def\fb@loadcfg{\PackageInfo{fetchbibpes}{Ignoring CFG file}}
873 \else
874     \def\fb@loadcfg{\InputIfFileExists{\fb@cfg@basename.cfg}
875         {\PackageInfo{fetchbibpes}{Inputting \fb@cfg@basename.cfg}}
876         {\PackageWarning{fetchbibpes}{\fb@cfg@basename.cfg not found}}}
877 \fi
878 \AtEndOfPackage{\fb@loadcfg}
879 %</package>
```

5 Retrieving only the verses needed

```
880 %<*sf>
```

One user wants to have *an entire book* (1Jn, for example) and to retrieve only the verses needed. Thus, if

```
\BV(book\chapter:verse\bible)\passage\null
```

is one of the required verses, it would be input as usual, otherwise `\BV` is set to `\fb@gobbletonull`.

```
881 \def\fb@gobbletonull#1\null{}
```

Proposed syntax to be developed and implemented.

```
\selectedVersesFrom
{
    {onlyverses={1Jn 1:1-5,3:3-8}}
    {from=ISV,onlyverses={Gen 1:1-5}}
    {onlyverses=Mat}
    ...
}
```

It is assumed the required DEF files are listed in the value of the `useverses` option of `fetchbibpes`.

`\selectedVersesFrom` We begin with `\selectedVersesFrom`. It takes one argument, that argument consists of a series of tokens as indicated above. The tokens take key-values, these are `onlyverses` and `from`. The `onlyverses` consists of an e-Sword abbreviation for a book (or the full name, which gets converted) followed by a space, followed by standard notation for chapter and verses, as in `onlyverses={1Jn 1:1-5,3:3-8}`. If things work, only the verses declared are available to the document, potentially saving TeX memory. The key `from` key is required if the passage does not come from KJV, any other version (ISV,KJV+) needs to be specified.

```
882 \define@key{sel@verses}{onlyverses}{\def\sel@verses@onlyverses{\#1}%
In this context, we are not fetching a Bible verse
883 \parsefetchchargefalse\fb@getBookAPassage#1 \@nil\parsefetchchargetrue
\fb@getBookAPassage gets \bib@book and \bib@passage
884 \ifx\bib@passage\empty
In this case, the book only was supplied
885 \else
Book and verse, remove final space
886 \expandafter\fb@StrpSpcAftrBk\bib@passage \@nil
887 \fi
888 }
889 \let\sel@verses@onlyverses\empty
890 \def\fb@StrpSpcAftrBk#1 \@nil{\edef\bib@passage{\#1}}
\iffb@fromused acts as a flag, set to true if the from key is specified.
891 \newif\iffb@fromused \fb@fromusedfalse
892 \define@key{sel@verses}{from}{\fb@fromusedtrue
893 \def@cargi{\#1}\ifx@cargi\empty
894 \edef\sel@verses@from{\fbdefaultBible}\else
895 \def\sel@verses@from{\#1}\fi
896 \edef\sel@verses@from{\fbdefaultBible}%
alt The alt allows you to specify an alternate translation of the passage.
897 \define@key{sel@verses}{alt}{\def\sel@verses@alt{\#1}}
898 \let\sel@verses@alt\empty
\selectedVersesFrom We now develop the \selectedVersesFrom command.
899 \def\selectedVersesFrom#1{%
900 \otfor@rg:=#1\do{%
901 \let\sel@verses@alt\empty
902 \edef\sel@verses@from{\fbdefaultBible}%
903 \edef\setkeysExp{\noexpand\setkeys{\sel@verses}{\@rg}}\setkeysExp
```

In case the author uses the full names, we do an inverse lookup, as needed.

```
904 \expandafter\fb@doInvLUAsNeeded\bib@book\@nil
```

We get each of the referenced verses (1:1-5,3:3-8) and mark them as special.

```
905      \ifx\bib@passage\empty\else
906          \expandafter\fb@getverses\expandafter{\bib@passage}\fi
```

We mark the book as special (selected retrieval), we append the `from` and the `alt` (normally `\empty`). We ‘register’ this Book as one from which to take selected passages by defining the command below. For example, if we declare the following `\selectedVersesFrom` in the preamble,

```
\selectedVersesFrom{
    {onlyverses={Col 1:6}}
    {alt=Alt,onlyverses={Col 1:6-8}}
    {from=YLT,alt=Alt,onlyverses={Gen 1:1}}
    {alt=Alt1,onlyverses={Col 1:6}}
    {onlyverses=Mat}
}
```

then commands with the following names are defined: `selb@Col KJV`, `selb@Col KJV Alt`, `selb@Gen YLT Alt`, `selb@Gen YLT`, `selb@Col KJV Alt1`, and `Mat KJV`, assuming `KJV` is the default Bible. If an author tries to fetch a ‘`Col KJV`’ passage, it may be undefined unless it is the particular passage requested (`Col 1:6`). In the case of `Mat`, where no verses are specified, the entire book of Matthew is excluded.

```
907      \csarg\def{selb@\bib@book\sel@verses@from\sel@verses@alt}{}%
908      \ifx\sel@verses@alt\empty\else
```

If `alt` is specified, we also select the same book, without the `alt` key.

```
909      \csarg\def{selb@\bib@book\sel@verses@from}{}\fi
910  }%
911 }
```

`\BV` The key to this feature is an intelligent `\BV` macro, here we redefined `\BV`. The original definition is

```
912 \let\fb@BV\BV
```

reproduced in `\fb@BV` we use it for ordinary passages and selected passages. Recall syntax for `\BV`, given through examples:

```
\BV(Gen 1:1 KJV) In the beginning ... and the earth.\null
\BV(Gen 1:1 ISV) In the beginning, ... the universe.\null
```

Some of the parsing below, grabs the book (`Gen`) and the translation (`KJV` in the first case and `ISV` in the second).

Now for the definition of the more discriminating version of `\BV`. In this context, we are not parsing a fetch verse argument.

```
913 \def\BV(#1){\parsefetchchargefalse\fb@getBookAPassage#1\@nil
914   \parsefetchchargetrue\edef\bib@passage@exp{\bib@passage\space}%
915   \expandafter\fb@gettransl\bib@passage@exp\@nil
916   \@ifundefined{selb@\bib@book\bib@transl}
```

If the book is not marked, that is, if `selb@\bib@book\bib@transl` is undefined we treat this as an ordinary passage, and use `\fb@BV`.

```
917   {\def\fb@next{\fb@BV(#1)}} % not a selected book
```

The book *is marked*, that is, the book is used for selected retrieval, we tread carefully with any of its passages.

```
918      {%
919      \@ifundefined{sel@#1}
```

The current passage reference (#1) is *not marked* for selected retrieval, so we gobble up everything to the terminating \null; this passage is not defined and is not available for fetching.

```
920      {\let\fb@next\fb@gobbletonull}
```

The current passage reference (#1) *is marked* for selected retrieval, so we treat it as an ordinary passage and use \fb@BV.

```
921      {\def\fb@next{\fb@BV(#1)}%
922      }\fb@next
923 }
```

What follows below are utility macros used above.

```
924 \def\fb@getPassageFrom#1 #2@nil{\def\bib@passage{#1}\def\bib@from{#2}}
925 \def\bib@transl@trimtrailspace#1 @nil{\def\bib@transl{ #1}}
926 \def\fb@gettransl#1 #2@nil{%
927   1:1 ISV vs just 1:1
928   \def\bib@transl{#2}\ifx\bib@transl\empty
929   \let\bib@transl\empty\else
930   \bib@transl@trimtrailspace#2\@nil\fi}
```

Get and mark the passages for selected retrieval.

```
930 \def\fb@getverses#1{%
931   1:1-5,3:3-8
932   @for\fb@versesvar:=#1\do{\fb@rmvspcsp{\fb@versesvar}\expandafter
933     \fb@markeach\expandafter{\fb@versesvar}}}
```

Mark the passage reference passed. We mark by creating a macro command names ‘\nameref{sel@1Jn 1:1}’ or ‘\namedef{sel@Gen 1:1 ISV}’, for example.

```
933 \def\fb@markeach#1{%
```

\fb@get@chptverse takes its argument (1:1-5), sets the chapter (\bib@chpt) and calculates \fb@verseEnd and \fb@verseStart.

```
934 \parsefetchargfalse\fb@get@chptverse{iftrue}#1@nil\parsefetchargtrue
```

Leading up to the \whilenum look, we set the range, for something like 1:1-5, we calculate \fb@verseEndpi to be \fb@verseEndp + 1.

```

937   \edef\fb@verseEndpi{\the@\tempcnta}%
938   @tempcnta\fb@verseStart\relax
939   @whilenum{@tempcnta<\fb@verseEndpi\relax}\do
940     {\csarg\edef{sel@\bib@book\space
941       \bib@chpt:\the@\tempcnta sel@verses@from\sel@verses@alt}{}
942     \advance@\tempcnta@ne}}
```

See the test file `bibpes_sf.tex`.

```
943 %</sf>
944 <*sr>
```

6 The \sr command

\sr is designed to be used with the bibleref-parse package. It is a command that takes two arguments, if the first one is non-empty, the text of the argument appears in *italics*. The second argument are references to one or more books of the Bible and passages within the books. The syntax for the second argument is illustrated by an example:

```
Psa 91:3,14-16;1Co 11; Galatians 5:6
```

The first two books referenced uses the three-letter abbreviation of e-Sword, the last one (Galatians) uses a full book name. The recognized full book names are the second arguments of the \fb@twoway command. Multiple passages within the same book are separated by commas, while references of different books are separated by semicolons. There can be a space following a semicolon. This second argument is passed to the \pibibleverse command of the bibleref-parse package.

```
945 \newcommand{\sr}[2]{\def\@rgi{\#1}\convBkN@mes{\#2}%
946   \ifx\@rgi\@empty\else\textit{\#1}\ \fi}
```

The converted version of #2 is in the \convdBkN@mes command, which we expand before \pibibleverse sees it.

```
947 \textbf{(\expandafter\pibibleverse\expandafter{\convdBkN@mes})}}%
```

\convBkN@mes converts the book names passed through the #1 argument to names recognized by the bibleref-parse package. As far as this package is concerned, we only are interested in the book names. The syntax of what we are parsing is as follows:

```
Book1\langle stuff1 \rangle; Book2\langle stuff2 \rangle; ...
```

\convBkN@mes searches through its argument, picking off the book and the stuff. \convdBkN@mes will hold the converted argument of #1.

```
948 \def\convBkN@mes#1{\let\convdBkN@mes\@empty
949   \convBkN@mes#1;\; \@nil}
950 \def\convBkN@mes#1 #2\@nil{%
951   \def\fb@thisbook{\#1}\fb@rmvspcsp{\fb@thisbook}%"
```

determine whether the number of tokens is three or more than three

```
952 \fb@ifItsiiiLtrs#1\@nil
\fb@ifItsiiiLtrs defines \fb@itsiii to be iftrue if there are only three letters, and to iffalse otherwise.
```

```
953 \csname\fb@itsiii\endcsname
```

Three tokens only, we use reverse lookup *Galatians* --> *Gal*, for example

```
954 \edef\fb@expand@add{\noexpand\g@addto@macro\noexpand
955   \convdBkN@mes{\@nameuse{rev@\fb@thisbook}}}\else
```

More than three letters, we assume author is passing a full book name (the second argument of one of the \fb@twoway commands).

```
956 \edef\fb@expand@add{\noexpand\g@addto@macro\noexpand

```

7 Fetching a substring of a verse

One user wants the ability to fetch a *substring of a verse*, go figure. Well, we'll try. We take the target verse and mark it off by inserting markers using basically the `replace` code. Using these markers, we extract the substrings.

We begin by defining new keys and supporting commands. We rely heavily on the earlier `replace` code.

```

977 \define@key{fbpesvprts}{marks}[] {\fp@cntArgs#1\stop@rg
978   \xdef\nMarks{\fp@nReplace}\def\fbpesvprts@marks{#1}%
979   \def\fbpes@replace{#1{}}
980 \let\fbpesvprts@marks@\empty
981 \define@key{fbpesvprts}{name}[] {\def@rgi{#1}%
982   \ifx@\rgi@\empty\else
983     \ifundefined{mvname#1}{\global\csarg\let{mvname#1}\null
984       \def\fbpesvprts@name{#1}}
985       {\PackageError{fetchbibpes}{%
986         The value assigned for the ‘name’ key\MessageBreak
987         is already in use, choose another}%
988         {Assign a value for ‘name’ in \string\markverse}%
989       }%
990   \fi
991 }

The fbpesfsubstr is for \fetchsubstrOf.

992 \define@key{fbpesfsubstr}{name}[] {\def@rgi{#1}%
993   \ifx@\rgi@\empty\else
994     \ifundefined{mvname#1}{% Not declared earlier by \markverse
995       \PackageError{fetchbibpes}{%
996         The value ‘#1’ has not been assigned earlier\MessageBreak
997         for the ‘name’ key in \string\markverse}%
998         {You’ve possibly mistyped the name,
999           or ‘name=#1’\MessageBreak was not declared earlier
1000           in a \string\markverse\space command}%
1001       }{\def\fbpesvprts@name{#1}}%
1002   \fi
1003 }

1004 \define@key{fbpesfsubstr}{begin}[] {\def\fbpesvprts@begin{#1}}
1005 \let\fbpesvprts@begin@\empty
1006 \define@key{fbpesfsubstr}{end}[] {\def\fbpesvprts@end{#1}}

10 Change History

v1.3 (2016/03/07)

General: Changed from inverse lookup to inverse
and reverse lookup. 37

v1.7 (2016/04/11)

General: Add three quote environments. 33

Added \fbResetMarParFmt to reset the
definition of \fbMarParFmt to its default,
given by \fb@DefaultMarParFmt. 34
Added , , and to reset the counters when
there are unbalanced quotes or apostrophes. 36

Added a color key, it colors the passage and the enclosing tokens.	14	Added new keys and supporting commands	44
Added formatting for the passage text.	15	Added the ability to extract segments of a verse	5
Added single quote counter	35	v2.3.2 (2018/03/21) \BV: Added an additional argument to \BV	6
Advance \fp@dqcnt and \fp@sqcnt globally	35	v2.3a (2016/12/20) General: Revised manual to include \markverse	5
Correct typos that prevented the roman key from working correctly (2-II and 3-III).	9	v2.4 (2018/03/21) General: Add an open ended range	22
Expand the first token of #1 before passing to \setkeys.	18	v2.4.1 (2018/03/21) General: remove spurious spaces from \bib@passage	20
v1.8 (2016/09/14) General: Added new key ltxquotes	12	v2.4.10 (2021/03/08) General: Changed default definition of \fbpes@case from \relax to \empty so \versetxt can be used in a label name.	15
Changes in quote handling routines to allow for latex markup for quotes.	35	Inserted \if@versetxt conditional	24
v1.9 (2016/09/15) General: Added \LaTeXQuotesOff and \LaTeXQuotesOn	12	\fetchverses: Insert \if@versetxt conditional when \fetchverses[typeset] is used.	28
\usePassage: Added \usePassage	6	Inserted \if@versetxt conditional	29
v2.0 (2016/09/17) General: Implement the replace option here	24	v2.4.3 (2018/06/27) General: Modified \fp@rq@choice to expand in mouth	36
Introduced the replace option for \fatchverse	13	\fetchverses: A quotes are literal, no special processing	26
v2.0a (2016/09/19) General: Added \letEach... \to	32	v2.4.4 (2018/07/11) General: Include verse numbers in the case of \fatchverses	23
Added nocite for \fatchverse only.	16	\fetchverses: Define \versetxt in all cases.	27
Added protection to the \whilenum loop.	22	v2.4.6 (2018/07/13) General: Added typeset*	17
Added special value 'none' for useverses	5	Change typeset so it has a value	17
v2.1 (2016/09/21) General: Added localdefs key	17	v2.4.7 (2018/07/20) General: Added switch \ifshowDefBible	18
Replace \let with \gdef, and protect the command body.	36	Define a global command \g@fbpes@transl	10
\fatchverses: Extended replace to \fatchverses	25	v2.4.8 (2018/07/28) General: Added \showTranslAlways and \showTranslDecl	18
\gobbleto: Added \gobbleto	14	Make \g@fbpes@transl public with \gtransl	10
v2.1a (2016/09/24) General: Added demo file <code>bibpes_red.tex</code>	5	\fetchverses: Added \translFmt and \translFmtDef	26
Revised documentation	5	Added \translTxtFmt and \translTxtFmtDef	26
v2.2 (2016/11/07) General: Added the alt* key	11	v2.4.9 (2018/07/30) General: Added the cfg option	5
v2.2a (2016/11/09) General: Added the switch \ifuseoldalt	11	\cobblevrs: Added \cobblevrs	30
v2.2b (2016/11/10) General: Remove trailing spaces from value of alt* key	30	\fetchverses: Expand book abbr early	27
v2.3 (2016/12/17) General: Added \iffb@doreplace	13
