FiXme – Collaborative annotation tool for IAT_FX^*

Didier Verna mailto:didier@didierverna.net http://www.lrde.epita.fr/~didier/

v4.5 (2019/01/03)

Abstract

FiXme is a collaborative annotation tool for LATEX documents. Annotating a document here refers to inserting meta-notes, that is, notes that do not belong to the document itself, but rather to its development or reviewing process. Such notes may involve things of different importance levels, ranging from simple "fix the spelling" flags to critical "this paragraph is a lie" mentions. Annotations like this should be visible during the development or reviewing phase, but should normally disapear in the final version of the document.

FiXme is designed to ease and automate the process of managing collaborative annotations, by offering a set of predefined note levels and layouts, the possibility to register multiple authors, to reference annotations by listing and indexing *etc.* FiXme is extensible, giving you the possibility to create new layouts or even complete "themes", and also comes with support for $AUCT_EX$.

The FiXme package is Copyright © 1998–2002, 2004–2007, 2009, 2013, 2017-2019 Didier Verna, and distributed under the terms of the LPPL license.

1 Installation

1.1 Extraction

If you are building FiXme from the tarball you need to execute the following steps in order to extract the necessary files. FiXme also requires the DoX package (version 2.0, release date 2009/09/21 or later), to build. It is not required to use the package.

```
[pdf]latex fixme.ins
[pdf]latex fixme.dtx
[pdf]latex fixme.dtx
makeindex -s gind fixme.idx
[pdf]latex fixme.dtx
[pdf]latex fixme.dtx
```

After that, you need to install the generated documentation and style files to a location where ${\rm IAT}_{\rm E} X$ can find them.

1.2 TDS-compliant layout

For a TDS-compliant layout, the following locations are suggested:

```
[TEXMF]/tex/latex/fixme/fixme.sty
[TEXMF]/tex/latex/fixme/layouts/fxlayout*.sty
[TEXMF]/tex/latex/fixme/layouts/env/fxenvlayout*.sty
[TEXMF]/tex/latex/fixme/layouts/target/fxtargetlayout*.sty
[TEXMF]/tex/latex/fixme/themes/fxtheme*.sty
[TEXMF]/doc/latex/fixme/fixme.[pdf|dvi]
```

1.3 AUCTEX support

AUCT_EX is a powerful major mode for editing T_EX documents in Emacs. In particular, it provides automatic completion of command names once they are known. FiXme supports AUCT_EX by providing a style file named fixme.el which contains AUCT_EX definitions for the relevant commands. This file should be installed in a place where AUCT_EX can find it (usually in a subdirectory of your IAT_EX styles directory). Please refer to the AUCT_EX documentation for more information on this.

2 Features summary

If you're new to FiXme, you might be interested in a brief summary of the features it provides. Otherwise, you may only take a look at the History section (section 5 on page 26) to see what's new.

Annotation levels FiXme annotations may be of four different importance levels, ranging from simple not-so-important notices to critical things that must absolutely be fixed in the final version.

Layouts and themes FiXme gives you full and extensible control on the layout of these annotations: they can be displayed inline, as marginal paragraphs, as footnotes and also in any kind of user-defined way. All these "layouts" may be combined together. FiXme also comes with support for "themes", globally modifying existing layouts, or providing new ones.

Annotation targets Annotations may be "targeted" to a specific portion of text that will be highlighted, and on the contrary "floating" around, in which case they may even appear in the document's preamble.

Listing and indexing Annotations may be indexed and summarized in a "list of fixmes".

Logging Annotations are recorded in the log file, and (depending on their importance level) some of them are displayed on the terminal during compilation. A final summary is also created at the end of the compilation process.

Modes All these features are actually available when you're working in draft mode. In final mode, the behavior is slightly different: any remaining critical note generates an error (the compilation aborts), while non critical ones are just removed from the document's body (they're still recorded in the log file though).

Authoring FiXme provides support for collaborative annotating by allowing you to "register" several authors.

Internationalization FiXme currently supports 7 different languages and features automatic language tracking for multilingual documents.

3 Using **FiXme**

3.1 Initialization

3.1.1 Requirements

In order to work properly, FiXme requires the presence of some IATEX packages. You don't have to load them explicitly though. As long as IATEX can locate them, they will be used automatically. FiXme currently depends on xspace, ifthen, verbatim and xkeyval (version 2.5f, release date 2006/11/18 or later).

3.1.2 Loading the package

In order to load FiXme, simply say \usepackage[(*options*)]{fixme} in the preamble of your document. There is an important number of options that you can use in order to customize FiXme's default or global behavior. These options will be discussed when appropriate.

There might be times where you would like to use LATEX commands in package options (for example, see section 3.9 on page 16). In such a case, you should know that LATEX normally can't handle this. In order to make it work, you need to use the xkvltxp package first, like this:

```
\usepackage{xkvltxp}
\usepackage[myoption=\mymacro]{fixme}
```

3.1.3 Global setup modification

 $fxsetup {(options)}$

Another way of customizing FiXme's global behavior is to use the \fxsetup command. \fxsetup understands the same options as the package itself and can be used in the preamble as well as in the document's body.

3.1.4 Local setup modification

Finally, note that unless specified otherwise, all package options are also understood by the annotation commands or environments described in section 3.2 on page 7. The effect is then local to that particular command.

3.2 Inserting **FiXme** notes

3.2.1 Commands

\fxnote [(options)]{(note)}
\fxwarning FiXme provides four annotation commands corresponding to different levels of
 importance (notes, warnings, errors and fatal errors). \fxfatal is a bit different
 \fxfatal from the other ones, as will be explained in section 3.4 on page 8.

\fixme

Warning: as of version 4, the \fixme command is a synonym for \fxfatal and is considered deprecated.

3.2.2 Targeted commands

 $fxnote* [(options)] {(note)} {(text)}$

\fxwarning* \fxerror* \fxfatal*

Sometimes, you might not only want to issue a FiXme note, but also highlight the relevant part of the text to which it applies. This is what I call "targeting" the annotation. As of version 4, FiXme provides starred versions of its annotation commands to do that. In star form, these commands expect an additional mandatory argument containing the text to be highlighted.

3.2.3 Environments

 $[\langle options \rangle] \{\langle summary \rangle\}$

Warning: as of version 4.0, the environment interface has changed and is not backward-compatible.

anfxnote anfxwarning anfxerror anfxfatal

FiXme annotations are normally meant to be short: consider that they are likely to go in the list of fixmes and in the index for instance. If you feel the need for writing longer comments, the environments described below might come in handy. FiXme provides four annotation environments; one for every note level. These environments take one mandatory argument (meant to be a short summary of the long note) and behave in exactly the same way as their command counterpart. The layout policy is a bit different though (see section 3.5 on page 8): the environment's contents will always appear inline, and the $\langle summary \rangle$ will obey all active annotation layouts except for the inline one, just as if it had been passed to one of the FiXme annotation commands described in the previous section.

afixme Warning: as of version 4, the afixme environement is a synonym for anfxfatal, and is considered deprecated.

3.2.4 Targeted environments

anfxnote*[(options)]{(summary)}{(text)}anfxwarning*FiXme environments can also be targeted to a specific portion of text. When using
the starred version, the environments expect one additional mandatory argument:
the text in question that will be highlighted.

3.3 List of FiXme's

listoffixmes	FiXme remembers where you put your annotations in a toc-like file whose extension
	is lox. The \listoffixmes command generates the annotations lists in a manner

similar to that of the "list of figures". A standard layout is automatically selected for the article, report and book classes and the AMS ones. If loaded, FiXme will also use the tocbasic package which makes it compliant with the KOMA-Script classes and any other document using it. If another class is used, the article layout is selected. Also, note that if there isn't any annotation left in the document, this command doesn't generate an empty list, but rather stays silent. It also stays silent in final mode, regardless of the presence of remaining annotations (see section 3.4 on page 8).

3.4 Controlling the behavior of FiXme

final draft

The behavior of FiXme is controlled by the two standard options final and draft. These options are usually given to \documentclass which in turn passes them to all packages. In addition, you can also use them as options to \usepackage, in the call to \fxsetup, and even to the annotation commands and environments.

In draft mode, annotations are recorded in the log file and appear in the document as specified by the layout settings (see section 3.5 on page 8). Additionally, warnings, errors and fatal errors are also displayed on the terminal.

In final mode, non fatal annotations (those generated by \fxnote, \fxwarning, \fxerror and their corresponding environments) are still logged, but they're not typeset. On the other hand, fatal ones (those generated by the \fxfatal command and the anfxfatal environment) will throw a LATEX error and thus interrupt or abort compilation with an informative message. This will help you track down forgotten important caveats in your document.

Let me rephrase: final documents can only have FiXme notes, warnings, and (non fatal) errors left. Of course, this is not completely true: remember that these options are understood locally by all the annotation commands and environments, so even in final mode, you can use something like this:

\fxfatal[draft]{bla bla}

status By default, FiXme is in final mode (LATEX itself behaves that way). If you're manipulating the document status at the level of FiXme itself (as opposed to the \documentclass level), then the preferred way to do this is to use the status option, and give it the value final or draft.

3.5 Controlling the layout of annotations

Annotations can appear in several forms in your document. Each of these forms can be individually selected, or they can be combined together to some extend.

3.5.1 Selecting a layout

3.5.1.1 Individual control

For each annotation layout, there is a corresponding boolean option (for instance, the "inline" layout is controlled by the inline option). These options are understood by the package itself, the \fxsetup command and also locally by every annotation command or environment. There are some restrictions on their usage however, as discussed in the next section.

To activate a layout, use the option alone or give it a value of true. For instance, these two forms are equivalent:

\fxnote[inline]{note...}
\fxnote[inline=true]{note...}

For convenience, each layout option has a counterpart that deactivates the corresponding layout. The counterpart option has the same name, prefixed with no (for instance, noinline). Again, these options are understood by the package itself, the \fxsetup command and also locally by every annotation command or environment (with the same usage restrictions, discussed in the next section). For instance, these two forms are equivalent:

```
\fxsetup{inline=false}
\fxsetup{noinline}
```

3.5.1.2 Global control

layout morelayout An even more convenient way to specify the required layout is to use the layout and morelayout options. In fact, the use of individual control is considered more or less deprecated. Both of these options take a comma-separated list of the individual options described above (this includes the no(option) form as well).

While the morelayout option *adds* to the current layout configuration, the layout one completely overrides it. For instance, knowing that by default, only the margin layout is active, the following forms are all equivalent:

```
\usepackage[nomargin,inline,index]{fixme}
\usepackage[margin=false,inline=true,index=true]{fixme}
\usepackage[morelayout={nomargin,inline,index}]{fixme}
\usepackage[layout={inline,index}]{fixme}
```

Again, these two options are understood by the package itself, the \fxsetup command and also locally by every annotation command or environment (with the same usage restrictions, discussed in the next section).

 $fxuselayouts {(name,...)}$

Finally, an alternative way of selecting (or deselecting) several layouts simultaneously is to use the \fxuselayouts command, giving it a comma-separated list of layout options as its only, mandatory, argument.

3.5.2 Built-in vs. external layouts

Annotation layouts are provided either in the core of $\mathsf{FiXme},$ or in separate files loaded dynamically on demand. Simple layouts are typically built-in, whereas those requiring additional packages are external, so that they don't consume $T_{E}X$ resources if not used. As a consequence, selecting an external layout might involve loading the relevant file first.

For technical reasons, it is not possible to do such a thing outside the preamble, neither in the middle of processing \usepackage options. As a result, layout options are restricted and you have three possibilities for using an external layout:

Name	External	Description
inline		Display note inline
margin		Display note in the margin
footnote		Display note in a footnote
index		Display note in the index
marginclue		Display a marginal clue
marginnote	*	Display non-floating note in the margin
pdfnote	*	Display note as inline PDF comment
pdfmargin	*	Display note as marginal PDF comment
pdfsignote	*	Display signed note ala pdfnote
pdfsigmargin	*	Display signed note ala pdfmargin
pdfcnote	*	Display colored note ala pdfnote
pdfcmargin	*	Display colored note ala pdfmargin
pdfcsignote	*	Display colored note ala pdfcsignote
pdfcsigmargin	*	Display colored note ala pdfsigmargin

Table 1: Available annotation layouts

- 1. Use its corresponding option in a call to \fxsetup in the preamble, like this: \fxsetup{(option)}. This will load it and select it immediately.
- Use the \fxuselayouts command in the preamble like this: \fxuselayouts{\(name\)}. This is strictly equivalent to the previous solution.

$fxloadlayouts {(name,...)}$

3 If on the other hand you want to load one or several external layouts without using them immediately (perhaps in order to use them locally in some specific annotation), use the \fxloadlayouts command in the preamble like this: \fxloadlayouts{(name),...}. After that, you can select any of those layouts anywhere you wish.

3.5.3 Available layouts

[no]inline
[no]margin
[no]footnote
[no]index

Table 1 lists the annotation layouts currently distributed with FiXme. By default, only the margin layout is active. Most of these layouts should be self-explanatory, but some precisions are given below.

3.5.3.1 marginclue

[no]marginclue

If your preferred layout is inline or say, footnote, it might be somewhat difficult to localize the annotation on the page, especially its vertical position. That's where marginal clues come into play. A marginal clue does not display the annotation's contents, but only an indication that there is one at that (vertical) position. So you need to use another layout as well (again, typically inline or footnote) in order to get the actual annotation.

Obviously, the margin and margin clue layouts are mutually exclusive, so if you try to activate both, only the most recently activated one will be enabled (and you'll get a notice in the log file and on the terminal).

3.5.3.2 marginnote

[no]marginnote

The marginnote layout is an alternate (external) way to display annotations in the margin, using the eponymous package. Contrary to IAT_EX's standard marginal paragraphs, the ones issued by marginnote are constructed in a non-floating way. This might be an advantage in some situations but marginnote also comes with some disadvantages of its own. For more information, please refer to marginnote's documentation, and also read the next section. Also, note that it is not currently possible to pass options to the \marginnote command through this layout.

For a reasonably robust marginal layout accross all annotations, including those issued in floats, consider using marginnote in conjunction with innerlayout=noinline (see section 3.5.4 on page 11).

3.5.3.3 PDF comments

[no]pdfnote [no]pdfmargin [no]pdfsignote [no]pdfsigmargin [no]pdfcnote [no]pdfcmargin [no]pdfcsignote [no]pdfcsigmargin The PDF format comes with a concept of *comment*, which FiXme can use to display its own annotations. Support for PDF comments varies across PDF viewers. Acrobat Reader is usually considered a reference, and MacOS X's Preview supports them reasonably well. The pdfnote and pdfmargin layouts use the pdfcomment package to display annotations as PDF inline or marginal comments.

The **sig** versions additionally display the author's tag (see 3.12 on page 18) as a signature instead of as a prefix.

The versions with a c in their name (as in color) use one of four different colors named $fx\langle level \rangle$ (according to the annotation's importance level). They also avoid printing the annotation's level since this information is already conveyed by the color.

3.5.4 Inner layout

There might be various reasons for you to change the layout locally for one particular annotation: creating a floating one is an example, see also section 3.5.5 on page 12 for some others. One frequent reason (described below) can be handled automatically by FiXme.

Remember that the default layout is to use margin paragraphs. Unfortunately, margin paragraphs are forbidden by T_EX in several situations, like a figure's caption for instance. If you try that, you will get a cryptic "Not in outer par mode" error message.

innerlayout

The good news is that this situation can be detected automatically. FiXme provides an option named innerlayout that allows you to specify an alternative layout setting to use when T_EX is in *inner* mode. In addition to that, FiXme automatically disables the margin and marginclue layouts. If you really want to use marginal paragraphs in inner mode, a good idea is then to set your inner layout to marginnote (see section 3.5.3.2).

Using innerlayout is not as trivial as it may seem: it *really* is an alternative layout configuration, and as such, you can use any combination you like of individual layout options, or you can even use the layout and morelayout options. This means that your alternative layout can either *add* to the existing one, or *override* it. Here are some examples to clarify things a little. You should try to understand them.

• By default, the FiXme inner layout is set to just inline. This can be simulated by the following call:

\usepackage[layout=margin,innerlayout={layout=inline}]{fixme}

• The following happens to give the same result in our particular case, while having a different semantics:

```
\usepackage[layout=margin,innerlayout=inline]{fixme}
```

• If you have set FiXme to use a safe layout globally (for instance, inline and index), and you want to use the same layout in inner mode, then you should provide an *empty* inner layout, like this:

```
\fxsetup{layout={inline,index},innerlayout=}
```

What would happen if you didn't provide the innerlayout option?

One final remark on the innerlayout option: this option is not processed immediately when you specify it, but instead, its value is stored and used only when needed. As a result, if you plan to use an external layout in inner mode (typically, marginnote), you need to load it explicitly in the preamble first. Use \fxloadlayouts for that.

3.5.5 Other common layout problems

This section describes some other common problems that people have encountered using FiXme. Although FiXme might not be directly responsible for them, it is still good to keep them in mind.

Annotations in captions being counted twice You are most likely using \listofsomething (figure, table, or any other kind of float). Note that a caption will be used twice here: once in the float itself, and once in the list of floats. Any FiXme annotation in the caption will consequently be generated twice as well. The solution to this problem is to use the optional argument to \caption, for example:

\caption[caption text]{caption text\fxnote{yuck!}}

Footnotes and margin paragraphs in floats Using footnotes in figures (and *a fortiori* in a figure's caption) does not work in general. Although there are some workarounds out there (for instance, using \footnotemark and \footnotetext directly), there is no completely reliable solution and it is not possible to detect that situation automatically. Similarly, marginal paragraphs will cause problems in a figure (even when not in its caption) because floats can't be nested in LATEX. Usual symptoms of these situations are: a footnote not being typeset, compilation breakage with the "Floats lost" message *etc.* If you're facing this problem, you need to change your layout locally.

Marginal paragraphs showing up on the wrong margin You want to look at the mparhack package.

ACM classes compatibility The ACM SIG classes (acm_proc_article-sp and sig-alternate) forbid the use of \marginpar, so if you use these classes, don't forget to choose another layout for FiXme, and also avoid using marginal clues.

Annotation indexing Remember that some characters are special in an index entry (the ! for instance). FiXme currently does nothing to escape those characters, so avoid using them in your annotations.

3.6 Corollary: floating annotations

At some point, people suggested that it would be nice to have global annotations, not related to any portion of the text in particular. Such annotations could be general comments about the whole document, and could even be issued in the preamble. This is what I call "floating" annotations.

I know you don't care, but originally, I started writing a new set of commands to do just that. However, with the flexibility that FiXme 4.0 provides, I quickly realized that such commands were an unnecessary addition.

Since floating anotations are not supposed to relate to any part of the text, they should not be typeset anywhere in it. This is especially true if you want to put some of them in the document's preamble. However, even a preamble annotation could be recorded and displayed in the index or in the list of fixmes. And it turns out that you can specify all that with the layout options described in section 3.5 on page 8.

target

The only remaining problem is the page number, which normally appears in the list of fixmes and in the index: if you choose to reference a floating annotation that way, the page number is likely to be completely meaningless. To compensate, a new option named target is provided. When used, the given value will replace the page number in both the index and the list of fixmes. The target can be anything you like, but should remain rather short. By default, target is set the special value thepage, which as you guessed means to use the page number.

The name "target" bears an intentional resemblance to FiXme's targeted commands and environments, because we are indeed targetting the annotation to something. The only difference is that in the case of floating annotations, the target is non-textual.

Here is an example of a floating annotation that would typically appear in the document's preamble:

```
\usepackage{hyperref}
\fxfatal[layout=index,target=hyperref]{Fill in PDF fields (title etc.)}
```

3.7 Controlling the layout of environments

As discussed in section 3.2 on page 7, the contents of a FiXme environment (a longer annotation) always appears inline. However, the exact way this contents is typeset (in draft mode only) is subject to a layout of its own, called the "environment layout".

3.7.1 Selecting a layout

envlayout The desired environment layout can be selected with the envlayout option. Contrary to the annotation layouts, only one environment layout can be active at a time. The envlayout option is understood by the package itself, the \fxsetup command and all the annotation environments (not the commands!). There are some restrictions on its usage however, as discussed in the next section. \fxuseenvlayout {\name}}

An alternative way of selecting an environment layout is to use the **\fxuseenvlayout** command, giving it the layout's name as its only, mandatory, argument.

3.7.2 Built-in vs. external layouts

Environments layouts are provided either in the core of $\mathsf{FiXme},$ or in separate files loaded dynamically on demand. Simple layouts are typically built-in, whereas those requiring additional packages are external, so that they don't consume $T_{E\!X}$ resources if not used. As a consequence, selecting an external layout with the <code>envlayout</code> option might involve loading the relevant file first.

 $fxloadenvlayouts {ame,...}$

fxerror

fxfatal

For technical reasons, it is not possible to do such a thing outside the preamble, neither in the middle of processing \usepackage options. As a result, the envlayout option is restricted and you have three possibilities for using an external layout:

- 1. Use the envlayout option in a call to \fxsetup in the preamble, like this: \fxsetup{envlayout=name}. This will load it and select it immediately.
- Use the \fxuseenvlayout command in the preamble like this: \fxuseenvlayout{name}. This is strictly equivalent to the previous solution.
- 3. If on the other hand you want to load one or several environment layouts *without* using them immediately (perhaps in order to use them locally in some specific annotation), use the \fxloadenvlayouts command in the preamble like this: \fxloadenvlayouts{\name\},...}. After that, you can select any of those layouts anywhere you wish.

3.7.3 Available layouts

Table 2 lists the environment layouts currently distributed with FiXme.

- plain The plain environment layout prints its contents as-is, only in bold font (by default) in order to distinguish it from the surrounding text.
 The signature environment layout prints the author's tag (see 3.12 on page 18) as a signature instead of as a prefix. This layout is used by the signature theme (see section 3.13 on page 21).
 Color fxnote fxnote fxvarning the annotation's importance level) to display its contents. It also avoids printing the annotation level, since that information is already con-
 - The color environment layout uses one of rour colors named 1X(*tever*) (according to the annotation's importance level) to display its contents. It also avoids printing the annotation level, since that information is already conveyed by the color. This layout is used by the color theme (see section 3.13 on page 21).

FiXme v4.5 (2019/01/03)

Name	External	Description
plain		Display contents as-is
signature		Display signed contents
color	*	Display contents in color
colorsig	*	Display signed contents in color

 Table 2: Available environment layouts

• The colorsig environment layout combines the features of the signature and color ones. This layout is used by the colorsig theme (see section 3.13 on page 21).

3.8 Controlling the layout of targets

As discussed in section 3.2 on page 7, the starred versions of the FiXme annotation commands and environments let you highlight a portion of text which is relevant to the current annotation. The exact way this textual target is typeset (in draft mode only; otherwise it is typeset as-is) is subject to a layout of its own, called the "target layout".

3.8.1 Selecting a layout

targetlayout The desired layout can be selected with the targetlayout option. Contrary to
the annotation layouts, only one target layout can be active at a time. The
targetlayout option is understood by the package itself, the \fxsetup command
and all the starred versions of the annotation commands and environments. There
are some restrictions on its usage however, as discussed in the next section.
{(name)}
An alternative way of selecting a target layout is to use the \fxusetargetlayout

command, giving it the layout's name as its only, mandatory, argument.

3.8.2 Built-in vs. external layouts

Target layouts are provided either in the core of $\mathsf{FiXme},$ or in separate files loaded dynamically on demand. Simple layouts are typically built-in, whereas those requiring additional packages are external, so that they don't consume $T_{E}X$ resources if not used. As a consequence, selecting an external layout with the <code>targetlayout</code> option might involve loading the relevant file first.

 $fxloadtargetlayouts {(name,...)}$

For technical reasons, it is not possible to do such a thing outside the preamble, neither in the middle of processing **\usepackage** options. As a result, the **targetlayout** option is restricted and you have two possibilities for using an external layout:

- 1. Use the targetlayout option in a call to \fxsetup in the preamble, like this: \fxsetup{targetlayout=name}. This will load it and select it immediately.
- Use the \fxusetargetlayout command in the preamble like this: \fxusetargetlayout{name}. This is strictly equivalent to the previous solution.

Name	External	Description
plain		Display target as-is
changebar	*	Display a vertical bar aside target
color	*	Display target in color
colorcb	*	Display a colored vertical bar aside target

3. If on the other hand you want to load one or several target layouts *without* using them immediately (perhaps in order to use them locally in some specific annotation), use the \fxloadtargetlayouts command in the preamble like this: \fxloadtargetlayouts{ $\langle name \rangle, \ldots$ }. After that, you can select any of those layouts anywhere you wish.

3.8.3 Available layouts

Table 3 lists the target layouts currently distributed with FiXme.

	3.9	Faces
colorcb fxnote fxwarning fxerror fxfatal	•	The colorcb target layout uses one of four colors named $fx\langle level \rangle$ (according to the annotation's importance level) to display a colored vertical bar in the margin, on the side of the target text.
color fxtarget	•	The color target layout uses the color named fxtarget to display the target text. This layout is used by the color and colorsig themes (see section 3.13 on page 21).
changebar	•	The changebar target layout displays a vertical bar in the margin, on the side of the target text.
plain	•	The plain target layout displays its contents as-is, only in italics (by default) in order to distinguish it from the surrounding text.

In the FiXme jargon, a "face" characterizes the visual aspect of some portion of text. If you're familiar with the Emacs editor, this will come as no surprise to you. FiXme provides several faces that allow you to further customize the layout of annotations or their targets.

3.9.1 Setting face values

There are different ways to customize a face. The first one is to use the corresponding face option. For each face $\langle name \rangle$, their is a $\langle name \rangle$ face option. For instance, the "inline" face is controlled by the inlineface option. Face options are understood by the package itself, the \fxsetup command and locally by all annotation commands or environments. Here is an example:

```
\fxsetup{inlineface=\bfseries}
```

Since you will probably want to use LATEX commands in face values, you should know that LATEX normally can't handle such commands in package options. If you want this to work, you need to use the xkvltxp package first, like this:

\usepackage{xkvltxp}
\usepackage[inlineface=\bfseries]{fixme}

\fxsetface {\(name\)}{\(value\)}
Another way to customize a face is to use the \fxsetface command by providing
the face name and the face value as two mandatory arguments. For example:

\fxsetface{inline}{\bfseries}

3.9.2 Available faces

- inline The inline face By default, the inline annotation layout displays its contents in bold font, to distinguish the note from the surrounding text. This is controlled by the inline face whose value is **\bfseries** by default.
- margin The margin face By default, the margin and marginclue layouts display their contents in footnote size. This is controlled by the margin face whose value is \footnotesize by default.
 - **env** The env face By default, the plain environment layout displays its contents in bold font, to distinguish it from the surrounding text. This is controlled by the env face whose value is **\bfseries** by default. The color and colorsig environment layouts honor this face as well, but reset it to $\langle nothing \rangle$ first. You should probably keep the same value for the inline and env faces, since they are both used to display annotations within the document's body.
- signature The signature face The signature environment layout honors the env face, and adds a signature face on top of it for the signature part. It is set to \itshape by default. The colorsig environment layout honors this face as well.
 - target The target face By default, the plain target layout displays its contents in italics, to distinguish it from the surrounding text. This is controlled by the target face whose value is \itshape by default. The changebar, color and colorcb target layouts honor this face as well, but reset it to (*nothing*) first.

3.10 Controlling the logging of annotations

As well as being displayed in the document itself, all annotations are "logged" in different ways: by default, simple notes are recorded in the log file while the others (warnings, errors and fatal errors) are also displayed on the terminal output during compilation.

[no]silent You have the ability to suppress logging altogether by using the silent option. This option is understood by the package itself, the \fxsetup command and all annotation commands and environments. Just as individual layout options, silent is a boolean option, so all those forms are possible: silent, equivalent to silent=true, and nosilent, equivalent to silent=false (the default).

3.11 Controlling the language of **FiXme**

3.11.1 Available languages

FiXme currently supports English (the default), French, Spanish, Italian, Gerenglish man, Danish and Croatian. You can select your preferred language by using french francais the corresponding language option. These options usually appear in the call to spanish \documentclass or \usepackage, but they are also understood by \fxsetup and all the annotation commands or environments. This allows you to change the seitalian lected language either globally or locally, and at any point in the document. The german french and francais options are synonyms. The german and ngerman options ngerman are currently equivalent. danish

croatian lang

If you're manipulating language settings at the level of FiXme itself (as opposed to the \documentclass level), then the preferred way to specify a language is to use the lang option, and give it the language name as a value. For instance:

\usepackage[lang=french]{fixme}

3.11.2 Language tracking

langtrack If the document you're working on has parts written in different languages, it might be the case that the annotations should follow the current language as well (especially if you're in collaborative mode; see section 3.12 on page 18). FiXme provides a boolean option named langtrack. When specified, FiXme assumes that you're using babel and automatically switches to the current language (as specified by babel's \languagename command), without requiring an explicit language option.

defaultlang

In the case where tracking falls on a language unsupported by FiXme, a warning will be issued and FiXme will switch to the language specified by the defaultlang option (english by default). If you happen to get one of these warnings, please consider sending me a patch with support for this new language (see section 6.12 on page 48).

Finally, note that specifying a language explicitly (by means of a language option) in the annotation commands and environments always takes precedence over the language tracking behavior.

3.11.3 Indexing in different languages

If your document contains annotations written in different languages, and you have requested the index layout, FiXme will not only classify the notes by their level of importance, but also by language. For example, if you have FiXme warnings in both English and French, you will find two different subcategories for warnings in the index: one called "Warnings" and one called "Avertissements".

3.12 Standalone or collaborative mode

 FiXme supports collaborative annotations as well as "standalone", single-author documents.

3.12.1 Standalone mode

By default, FiXme is in standalone mode, meaning that it assumes there is only one person annotating the document. This has several implications on the layout. If you've tried it already, you may have noticed the following points.

- All the built-in annotation layouts (index excepted) put the FiXme logo in front of every note. This is also true for the environments. The idea is to distinguish FiXme contents from the rest of the document (for instance other marginal notes or footnotes).
- All annotations are indexed under the main FiXme category, and sorted by importance level, but the FiXme logo is not repeated constantly (that would be useless).
- Similarly, the list of fixmes does not clutter itself with the logo, because we already know that its contents is specific to FiXme.

As a matter of fact, when you see the FiXme logo appear somewhere, you're not actually contemplating it, but rather the annotation's *author*. It just happens that by default (meaning in standalone mode), the only author is FiXme itself.

author

In standalone mode, you might be annoyed by this orgy of FiXme logos. This might happen if for instance you're using the margin layout and you *know* there is nothing but FiXme annotations in there. In such a case, you will most likely want to change the author to *nothing*. This can be accomplished by using the author option, which is understood by the package itself, the \fxsetup command and all the annotation commands or environments. Doing something like the following will get rid of the damn logo for good:

\usepackage[author=]{fixme}

3.12.2 Collaborative mode

If, on the other hand, you're working in collaboration with other people, every potential "fixer" might want to tag his or her own annotations. So assuming that John Doe is another author, he would most likely do something like this:

```
\fxfatal[author=JD]{rephrase this}
```

And suddenly, John's fatal comment will be prefixed with his initials. This is not a very satisfactory solution however, because it would require you to explicitely provide the author's tag in every single note you create. Fortunately, FiXme offers an easier way to achieve this.

3.12.2.1 Registering new authors

$\FXRegisterAuthor \quad \{\langle cmdprefix \rangle\} \{\langle envprefix \rangle\} \{\langle tag \rangle\}$

The command FXRegisterAuthor registers a new author with FiXme. It takes three arguments: the last one $(\langle tag \rangle)$ is just the same as the value you would pass to the **author** option: it will serve as a prefix (or signature) for John's annotations. In addition to that, a complete new set of user-level commands (prefixed with $\langle cmdprefix \rangle$) and environments (prefixed with $\langle envprefix \rangle$) will be created. To clarify, suppose that we have registered John like this:

\FXRegisterAuthor{jd}{ajd}{JD}

Now, John can use the commands \jdnote, \jdwarning etc., along with their starred versions, and he can also use the environments ajdnote, ajdwarning etc., along with their starred versions as well. If you really want to know the whole story, it turns out that the main FiXme interface described in section 3.2 on page 7 is created with this single line of code:

\FXRegisterAuthor{fx}{anfx}{fixme}

Warning! $\langle cmdprefix \rangle$ and $\langle envprefix \rangle$ need to be different, or you will get very strange errors. The technical reason is that in LATEX, an environment named foo is defined in terms of two commands: foo and endfoo (yes, this is silly; the first one should really be beginfoo). As a consequence, if you use the same prefix, you will get a name clash between the annotation commands and environments.

3.12.2.2 Fun with the author option

Some precisions about the author option are in order here. When a new author is registered with FiXme, the generated commands and environments work by *presetting* the author option to the specified $\langle tag \rangle$. This means that it is still possible to override it explicitly like this:

\jdfatal[author=Anonymous]{For \$500.00, you got your Ph.D.}

I don't see any good reason for doing it though, the above example notwithstanding.

The final remark is about the default fx* user interface: the fixme default user is special in that it is the only registered user to honor a global author option (provided in the call to \usepackage or \fxsetup). The intended use of this is that the *main* author of the document uses the fx* interface (preferably with a personal author setting, different from the FiXme logo), and all other authors are registered via \FXRegisterAuthor.

3.12.2.3 Globally switching to collaborative mode

We're getting close, but we're not quite there yet. Perhaps you would like to see the tags from the different authors in the list of fixmes, or even in the index? Remember that FiXme is in standalone mode by default, so the (only) tag does not appear in those places.

singleuser If you want this additional information, you've got to ask FiXme to globally switch
multiuser
mode to collaborative mode. This can be done with either one of the three options
singleuser, mutliuser or mode. singleuser and multiuser are boolean options. The mode option takes a value of either singleuser or multiuser. This
is the preferred way to switch the mode. These options are understood globally
by \usepackage or \fxsetup, and also locally by the annotation commands or
environments.

When collaborative mode is active, FiXme adjusts the list of fixmes layout to display the authors tags as well. Additionally, the annotations are indexed as before, but additional index entries, sorted by author, are generated as well.

3.13 Themes

Themes are orthogonal to layouts: they provide a way to modify the overall appearance of FiXme by overriding the existing layouts and/or by providing new ones. In fact, a theme can be any kind of customization that you would otherwise put in your preamble.

3.13.1 Using themes

theme The interface for using a theme is quite simple: use the theme option and give it the name of the theme you want to use. Themes are always external: there are none in the core of FiXme but instead they are provided as independent files. As a consequence, the theme option has the same usage restrictions as all the layout options we've encountered so far. Moreover, it is not possible to "maintain" several themes and switch between them in a single document. Themes can be loaded only in the preamble.

$fxusetheme {\langle name \rangle}$

An alternative to the theme option is to use the \fxusetheme command, which takes the theme's name as its only mandatory argument.

3.13.2 Available themes

FiXme comes with a number of predefined themes listed below.

3.13.2.1 The signature theme

signature This theme uses the **signature** environment layout (see section 3.7.3 on page 14), and overrides the built-in ones to display the author tags as a signature (*i.e.* at the end of the annotations) instead of as a prefix. All original layout faces are honored.

3.13.2.2 The color theme

color This theme uses the color environment and target layouts (see sections 3.7.3 on page 14 and 3.8.3 on page 16), and overrides the built-in ones to use different colors for the different annotation levels. As a consequence, it also avoids printing the annotation names because this information is already contained in the colors themselves. All original layout faces are honored, but the inline one is reset to $\langle nothing \rangle$. Remember that the env and target faces are reset as well (this is actually done by the color environment and target layouts).

3.13.2.3 The colorsig theme

colorsig This theme combines the features of the color and signature ones. All original layout faces are honored, but the inline one is reset to $\langle nothing \rangle$.

4 Extending FiXme

Hear hear, this is where you start spending more time hacking $E^{T}E^{X}$ than actually writing your document...

4.1 Modifying existing layouts

FiXme annotations, environment and target layouts are implemented as a (set of) commands conforming to strict prototypes. If you're not happy with the way they perform, you have the possibility to \renewcommand them (in fact, you should use \renewcommand* for annotation and environment layouts). In such a case, it is probably best to have a look at the code in order to figure out how the original ones are written. However, a description of their prototypes is given below.

4.1.1 Modifying existing annotation layouts

 $TxLayout(name) = {\langle type \rangle} {\langle annotation \rangle} {\langle author \rangle}$

Each annotation layout is implemented as a macro taking three mandatory arguments. By convention, this macro is named FXLayout(name), for instance FXLayoutInline. $\langle type \rangle$ is the annotation type. It can be one of note, warning, error and fatal. $\langle annotation \rangle$ is the annotation itself, and $\langle author \rangle$ is the author's tag.

4.1.2 Modifying existing environment layouts

\FXEnvLayout(name)Begin
\FXEnvLayout(name)End

 $\{\langle type \rangle\}\{\langle author \rangle\}$

Each environment layout is implemented as two macros taking two mandatory arguments. By convention, these macros are named FXEnvLayout(name)Begin and FXEnvLayout(name)End, for instance FXEnvLayoutPlainBegin and FXEnvLayoutPlainEnd. $\langle type \rangle$ is the annotation type. It can be one of note, warning, error and fatal. $\langle author \rangle$ is the author's tag.

4.1.3 Modifying existing target layouts

$FXTargetLayout(name) = {\langle type \rangle} {\langle target \rangle}$

Each target layout is implemented as a macro taking two mandatory arguments. By convention, this macro is named FXTargetLayout(name), for instance FXTargetLayoutPlain. $\langle type \rangle$ is the annotation type. It can be one of note, warning, error and fatal. $\langle target \rangle$ is the textual target.

4.2 Creating new layouts

Creating a new layout first requires that you write new layout macros as described in the previous section. Once you've done that, the next step is to make FiXme aware of this addition. This is called "registering" a layout.

4.2.1 Registering a new annotation layout

4.2.1.1 Early vs. late layouts

Normally, FiXme typesets your annotations at the current position in the text, using a sensible order for built-in layouts. For instance, the footnote layout, if active, is performed before the inline one, so that the footnote mark is sticked to the preceding text and not to the annotation. When using targeted commands or environments, the situation is a bit more complex: some layouts make more sense at the beginning of the textual target, and some others at the end. The former ones are called "early layouts" and the later ones are called "late layouts". A typical example of an early layout is the margin one: if you're highlighting a long portion of text, it is more convenient to see the marginal note appear near the top of that text, rather than near the end of it (a nice illustration of this is to combine the changebar target layout and margin annotation layout). As for built-in layouts, only the margin and marginclue ones are early. All others are late. When you create a new layout, you need to decide whether it is an early or a late one.

4.2.1.2 Registering late layouts

$FXRegisterLayout [\langle mutex \rangle] \{\langle name \rangle\} \{\langle macro \rangle\}$

In order to register a late annotation layout with FiXme, use the command FXRegisterLayout. This macro has two mandatory arguments: the layout $\langle name \rangle$ (at least 3 characters long) and the associated layout $\langle macro \rangle$. For instance, the inline layout is registered like this:

\FXRegisterLayout{inline}{\FXLayoutInline}

Once registered, the new layout gets a boolean option $\langle name \rangle$ and is also recognized by the layout and morelayout options, as well as by the \fxuselayouts command as $\langle name \rangle$.

The first (optional) argument $\langle mutex \rangle$ is a comma-separated list of other layout names that should be in mutual exclusion with the layout we are registering (for example, the margin and marginclue layouts are in mutual exclusion). Note that mutual exclusion between two layouts need only be registered once. In other words, a previsouly registered layout will automatically be made aware of subsequent mutex declarations.

4.2.1.3 Registering early layouts

\FXRegisterLayout*

In order to register an early annotation layout with FiXme, use the starred form of \FXRegisterLayout. Everything else behaves the same.

4.2.1.4 Providing a layout

 $[\langle mutex \rangle] \{\langle name \rangle\} \{\langle macro \rangle\}$

\FXProvidesLayout {\(name\)} [\(release information\)]
If you want to save your layout externally, you need to store it in a file named
fxlayout\(name\).sty and advertise it by calling \FXProvidesLayout. It will then
be recognized by the \fxloadlayouts command as \(name\).

FiXme v4.5 (2019/01/03)

4.2.2 Registering a new environment layout

\FXRegisterEnvLayout $\{\langle name \rangle\}\{\langle begin \rangle\}\{\langle end \rangle\}$ In order to register a new environment layout with FiXme, use the command \FXRegisterEnvLayout. This macro has three mandatory arguments: the layout $\langle name \rangle$ and the associated $\langle begin \rangle$ and $\langle end \rangle$ macros. For instance, the color layout is registered like this: \FXRegisterEnvLayout{color}{\FXEnvLayoutColorBegin}{\FXEnvLayoutColorEnd} Once registered, the new layout is recognized by the envlayout option and by the fxuseenvlayout command as (name).\FXProvidesEnvLayout $\{\langle name \rangle\} [\langle release information \rangle]$ If you want to save your layout externally, you need to store it in a file named fxenvlayout $\langle name \rangle$.sty and advertise it by calling FXProvidesEnvLayout. It will then be recognized by the fxloadenvlayouts commands as $\langle name \rangle$. 4.2.3Registering a new target layout $\{\langle name \rangle\}\{\langle macro \rangle\}$ \FXRegisterTargetLayout In order to register a new target layout with FiXme, use the command \FXRegisterTargetLayout. This macro has two mandatory arguments: the layout $\langle name \rangle$ and the associated $\langle macro \rangle$. For instance, the color layout is registered like this: \FXRegisterTargetLayout{color}{\FXTargetLayoutColor} Once registered, the new layout is recognized by the targetlayout option and by the fxusetargetlayout as (name). \FXProvidesTargetLayout $\{\langle name \rangle\} [\langle release information \rangle]$ If you want to save your layout externally, you need to store it in a file named fxtargetlayout(*name*).sty and advertise it by calling \FXProvidesTargetLayout. It will then be recognized by the fxloadtargetlayouts commands as $\langle name \rangle$. 4.3 Adding new options Note: FiXme uses the **xkeyval** package for its underlying options management, so some knowledge of this package is required in order to understand the remainder of this section.

Yet another way to customize FiXme is to plug additional behavior in, by way of options. As of version 4.5, FiXme provides a convenient interface for creating new options, and associate them with code to execute.

First of all, new options must belong to a "family", which essentially defines exactly where they make sense. FiXme currently provides three option families: Layout, EnvLayout, and TargetLayout. Obviously, these families allow you to define options that will affect the behavior of the corresponding three kinds of layouts.

For each family, FiXme provides five commands wrapping around **xkeyval** to define special kinds of options (*keys* in the **xkeyval** jargon). They are explained below.

FiXme v4.5 (2019/01/03)

$FXDefine{family}Key$	$\{\langle key \rangle\} [\langle default \rangle] \{\langle function \rangle\}$ Define an xkeyval ordinary $\langle key \rangle$ belonging to $\langle family \rangle$.
$FXDefine \langle family angle CmdKey$	$[\langle mp \rangle] \{\langle key \rangle\} [\langle default \rangle] \{\langle function \rangle\}$ Define an xkeyval command $\langle key \rangle$ belonging to $\langle family \rangle$.
FXDefine (family)ChoiceKey	$\{\langle key \rangle\} [\langle bin \rangle] \{\langle alternatives \rangle\} [\langle default \rangle] \{\langle function \rangle\}$ Define an xkeyval choice $\langle key \rangle$ belonging to $\langle family \rangle$.
\FXDefine $\langle family angle$ VoidKey	$\{\langle key \rangle\}\{\langle func \rangle\}\$ A "void $\langle key \rangle$ " is an option that is not supposed to get an argument. This property is automatically checked everytime the option is used.
\FXDefine $\langle family angle$ BoolKey	<pre>[(func)] {(key)} Finally, a "boolean (key)" is like an xkeyval one, with the addition that for every such key, there is a void nokey counterpart. Every new option you define is inserted into the global options management mechanism, which has some implications.</pre>
	• First of all, new options are automatically available almost everywhere, and in particular in the \fxsetup macro, in the annotations commands and environments, <i>etc.</i> Note however that the EnvLayout and TargetLayout family options are only processed when it makes sense, that is, when environments or targeted commands are involved.
	• Because new options are treated globally, they may affect every layout (ex- isting, loaded in the future, <i>etc.</i>) and of course, also the built-in ones. Sup- pose, for example, that you want the ability to adjust the vertical position of the marginal notes layout. One solution is to create a vadj option like this: \FXDefineLayoutKey{vadj}{\def\marginnotevadjust{#1}}, which you can then use like that: \fxnote[vadj=.5ex]{}.
	• Finally, and again, because options are treated globally, beware of name clashes! Every option name must be unique within a family.
	4.4 Creating a new theme
\FXRequireLayouts	Creating a new theme may involve anything from using (by way of \fxsetup) or modifying existing layouts, to providing new ones. If your new theme has specific layouts, you may consider writing them in separate files as described before, in order to make them more generally available. { $\langle layout names \rangle$ }
	In order to use external layouts in a theme, use the command $FXRequireLayouts$, passing it a list of $\langle layout names \rangle$ as argument.
\FXRequireEnvLayout \FXRequireTargetLayout	$\{\langle name \rangle\}\$ In order to use and external environment or target layout in a theme, use the commands \FXRequire*Layout and give them the layout's name as argument.
\FXProvidesTheme	commands $\{r_{R}, r_{eq}, r_{$

4.5 Internationalization

fx(lang)name FiXme's language control has been described in section 3.11 on page 18. For every fx(lang)sname

supported language $\langle lang \rangle$, a number of macros define the language-dependent part of FiXme. The commands $fx\langle lang\rangle$ notename, $fx\langle lang\rangle$ notesname, and their equivalent for the other annotation levels define the singular and plural forms of the note names.

 $\langle lang \rangle$ listfixmename

The title for the list of fixmes is defined by the command \(*lang*)listfixmename. All of these commands may be renewed, and their values will be honored by FiXme in all situations, including potential language changes across the document.

5 History

- v4.5 Public interface for extending FiXme with new key/value options.
 - Revamp the AUCTEX support, with help from Arash Esbati and Ikumi Keita.

Fix PDF signature layouts not working anymore, reported by Soeren Wolfers.

Fix spurious space at the end of environments contents, reported by Frank Mittelbach.

v4.4 Handle existing yet empty lox file properly, meaning don't actually typeset an empty list of corrections.Don't update the lox file in final mode, avoiding potential typesetting artifacts, reported by Lars Madsen.

Various internals and documentation improvements.

v4.3 Add a paragraph about the duplication of notes in captions, upon exchange with Kreuvf.

Update support for the KOMA-Script classes by using the tocbasic interface when available, reported by Dirk Surmann.

Separate inline notes from the text they follow, suggested by Victor Porton. Fix potential inline layouts color leakage, reported by Victor Porton.

Fix several parsing problems when passing optional arguments containing brackets, thanks to Joseph Wright and Lars Madsen.

- v4.2 Improve Danish translation, thanks to Lars Madsen. Fix buglet in \@wrindex redefinition, reported by Norman Gray.
- v4.1 8 new PDF-specific annotation layouts. New annotation layout: marginnote, suggested by Sébastien Mengin. Better mechanism for handling layout mutual exclusion. Fix bug in inner layout processing.

v4.0 Support for collaborative annotations, suggested by Michael Kubovy. Support for "targeted" notes and environments (highlighting a portion of text), suggested by Mark Edgington. Support for "floating notes" (not specific to any portion of text), suggested by Rasmus Villemoes. Support for alternative layout autoswitch in T_EX's inner mode, suggested by Will Robertson. Support for automatic language tracking in multilingual documents. Support for themes. Extended support for user-provided layouts. Support for key=value argument syntax in the whole user interface. New command \fxsetup. Homogenize the log and console messages. Heavy internals refactoring.

v3.4 \fixme, \fxerror, \fxwarning and \fxnote are now robust, thanks to Will Robertson.

Fix incompatibility with KOMA-Script classes version of **\@starttoc** when the lox file is inexistent, reported by Philipp Stephani.

v3.3 Document incompatibility between marginal layout and the ACM SIG classes, reported by Jochen Wuttke. Honor twoside option in marginal layout, suggested by Jens Remus.

Support for KOMA-Script classes version 2006/07/30 v2.95b, suggested by Jens Remus.

Documentation improvements suggested by Brian van den Broek.

Fix incompatibility with amsart reported by Lars Madsen: \@starttoc takes two arguments.

Fix bug reported by Stefan Mann: a typo in the fixme@footnotetrue macro name.

v3.2 Added the marginclue layout option which only signals a fixme in the margin, withtout the actual contents. Support for Croatian thanks to Marcel Maretic. Fix incompatibility with amsbook reported by Claude Lacoursière: \@starttoc

takes two arguments. Fix incompatibility with Beamer reported by Akim Demaille: protect contents of lox file.

- v3.1 Fix bug reported by Arnold Beckmann: the environments were visible in final mode.
- v3.0 Added environments corresponding to the annotation commands. Added an optional first argument to the annotation commands to change the layout locally. Fix bug reported by Akim Demaille: marginal notes could mess up the document's layout by flushing it right.
- v2.2 New option silent to suppress notes logging. Support for Danish thanks to Kim Rud Bille.
- v2.1 Use \nobreakspace instead of the tilda character. This avoids conflicts with Babel in Spanish environments. Fix bug reported by Knut Lickert: index entries were unconditionally built.
- v2.0 New feature: note levels. New feature: FiXme note counters and usage summary. Suggestions from Kasper B. Graversen. Support for Spanish thanks to Agustín Martín.
- v1.5 New appearance option: inline.

- v1.4 Support for the KOMA-Script classes. Fix bug reported by Ulf Jaenicke-Roessler: the \listoffixmes command didn't work when called before the first FiXme note.
- v1.3 Support for Italian thanks to Riccardo Murri.
- v1.2 Support for German thanks to Harald Harders.

6 Implementation

6.1 Preamble

```
1 (fixme)
                 2 \NeedsTeXFormat{LaTeX2e}
                 3 \langle *header \rangle
                 4 \ProvidesPackage{fixme}[2019/01/03 v4.5 Collaborative annotations for LaTeX2e]
                 5
                 6 (/header)
                Some required packages:
                 7 \langle * fixme \rangle
                 8 \RequirePackage{ifthen}
                 9 \RequirePackage{verbatim}
                10 \RequirePackage{xkeyval}[2006/11/18]
                11
                12 \langle / fixme \rangle
 \fixmelogo
               The FiXme logo:
                13 \langle *header \rangle
                14 \newcommand\fixmelogo{\textsf{FiXme}}
                15
                16 \langle /header \rangle
                        Utilities
                6.2
                6.2.1
                         Miscellaneous
\@fxpkginfo
               \{\langle msg \rangle\}
               Issue a FiXme package info or warning:
```

```
\@fxpkgwarning
                   17 (*fixme)
                   18 \newcommand\@fxpkginfo{\PackageInfo{FiXme}}
                   19 \newcommand\@fxpkgwarning{\PackageWarning{FiXme}}
                  \{\langle shortmsg \rangle\}\{\langle longmsg \rangle\}
  \@fxpkgerror
                   Issue a FiXme package error:
                   20 \newcommand\@fxpkgerror{\PackageError{FiXme}}
                   21
 \langle list \rangle \{\langle elt \rangle\}
                   Add \langle elt \rangle at the end of \langle list \rangle. We should check for duplicates, but this is not
                  currently done.
                   22 \newcommand*\@fxaddtolist[2]{%
                   23
                       \expandafter\ifx\csname #1\endcsname\relax%
                          \expandafter\def\csname #1\endcsname{#2}%
                   24
```

```
25 \else%
26 \expandafter\ifx\csname #1\endcsname\empty%
27 \expandafter\g@addto@macro\csname #1\endcsname{#2}%
28 \else%
29 \expandafter\g@addto@macro\csname #1\endcsname{,#2}%
30 \fi%
31 \fi}
32
```

6.2.2 Key-value management (xkeyval)

6.2.2.1 Shortcuts

The following macros are simple shortcuts for using xkeyval with the fx prefix.

\@fxkeyifundefined	$ \{\langle families \rangle\} \{\langle key \rangle\} \{\langle then \rangle\} \{\langle else \rangle\} \\ 33 \end{tabular} $
\@fxdefinekey	$ \{\langle family \rangle \} \{\langle key \rangle \} [\langle default \rangle] \{\langle function \rangle \} \\ 34 \end{tabular} $
\@fxdefinecmdkey	$ \{ \langle family \rangle \} [\langle mp \rangle] \{ \langle key \rangle \} [\langle default \rangle] \{ \langle function \rangle \} \\ 35 \newcommand \Cfxdefinecmdkey { \defineCmdkey [fx] } $
\@fxdefinechoicekey	$ \{\langle family \rangle \} \{\langle key \rangle \} [\langle bin \rangle] \{\langle alternatives \rangle \} [\langle default \rangle] \{\langle function \rangle \} \\ 36 \newcommand \Gfxdefinechoicekey \{\define@choicekey[fx] \} $
\@fxsetkeys	${\langle families \rangle} [\langle na \rangle] {\langle keys \rangle}$ 37 \newcommand\@fxsetkeys{\setkeys[fx]}
\@fxpresetkeys	<pre>{\families\}{\langle head keys\}{\langle tail keys\} 38 \langle Note: currently unused 39 \langle \newcommand\@fxpresetkeys{\presetkeys[fx]} 40</pre>
	6.2.2.2 Wrappers
\@fxvoidkeyerror	<pre>{\key\}{\value\} Issue a FiXme error about a void \key\ misuse (see below): 41 \newcommand*\@fxvoidkeyerror[2]{% 42 \@fxpkgerror{misuse of key '#1'}{% 43 You have given the key '#1' the argument '#2' but it takes 44 none.\MessageBreak 45 Type X to quit, fix that key and re-run LaTeX.\MessageBreak}</pre>
\@fxdefinevoidkey	<pre>{\family\}{\langle key\}{\func\} A FiXme "void \langle key\rangle" isn't supposed to get an argument. 46 \newcommand*\@fxdefinevoidkey[3]{\langle 47 \define@key[fx]{#1}{#2}[]{\langle 48 \ifthenelse{\equal{##1}{}\\ 49 #3}{\langle 41 = 10000 = 100000 = 100000 = 100000 = 100000000</pre>

- 50 \@fxvoidkeyerror{#2}{##1}}}
- 51

FiXme v4.5 (2019/01/03)

 $\fill (func)] \{ \langle family \rangle \} \{ \langle key \rangle \}$

A FiXme "boolean $\langle key \rangle$ " is like an **xkeyval** one, with the addition that for every such **key**, there is a void **nokey** counterpart.

52 \newcommand*\@fxdefineboolkey[3][]{%
53 \define@boolkey[fx]{#2}{#3}[true]{#1}
54 \@fxdefinevoidkey{#2}{no#3}{\@nameuse{fx@#2@#3}{false}}}
55

6.2.2.3 Extension-level option creation interface

 $\fill (infix)$

\FXDefine...Key \FXDefine...CmdKey \FXDefine...ChoiceKey \FXDefine...VoidKey \FXDefine...BoolKey This macro defines the extension-level interface allowing users to define new **xkeyval** options for a certain $\langle family \rangle$. Note that the core of FiXme could use those interfaces once defined, but it wouldn't bring much to the picture. Indeed, it basically boils down to using a $\langle family \rangle$ within the names of the macros instead of as an argument (and avoiding the use of the "at" character).

```
56 \newcommand*\@fxdefineoptioninterface[2]{%
                     \expandafter\newcommand\csname FXDefine#2Key\endcsname{%
57
                               \fi e = \fi 
58
                     \expandafter\newcommand\csname FXDefine#2CmdKey\endcsname{%
59
                              \fill \in \mathbb{R}^{m} 
60
                     \expandafter\newcommand\csname FXDefine#2ChoiceKey\endcsname{%
61
                              \mathbb{P}^{\pi}
62
                     \expandafter\newcommand\csname FXDefine#2VoidKey\endcsname{%
63
                              \fill \{\#1\}\}
64
65
                     \expandafter\newcommand\expandafter*\csname FXDefine#2BoolKey\endcsname[2][]{%
66
                              67
```

6.3 List macros

6.3.1 Contents lines

\l@fixme We use the same layout as for the list of figures. 68 \let\l@fixme\l@figure

> This macro is copied almost verbatim from IATEX's core. The intent is to do a similar layout, but replacing the last argument, normally a page number, by arbitrary text (in our case, a note's target). The original macro defines a restricted width to typeset the page number which is much too short for us, so we just let the $\langle target \rangle$ text take all the space it needs.

69 \newcommand*\@fxdottedtocline[5]{%

- 70 \ifnum #1>\c@tocdepth \else
- 71 $vskip \z@ \plus.2\p@$
- 72 {\leftskip #2\relax \rightskip \@tocrmarg \parfillskip -\rightskip
- 73 \parindent #2\relax\@afterindenttrue
- 74 \interlinepenalty\@M
- 75 \leavevmode
- 76 \@tempdima #3\relax
- 77 \advance\leftskip \@tempdima \null\nobreak\hskip -\leftskip
- 78 ${#4}\nobreak$

- 79 \leaders\hbox{\$\m@th
- 80 \mkern \@dotsep mu\hbox{.}\mkern \@dotsep
- 81 mu\$}\hfill
- 82 \nobreak
- 83 **#5\par}%**
- 84 \fi}

$fxcontentsline {(contents)}{(target)}$

Similar to IAT_EX 's \contentsline macro, but temporarily bind \@dottedtocline to our own version. The nice thing about this implementation is that we can still use \l@fixme (remember that it is bound to \l@figure) without exactly knowing what its definition is. This macro is at the user level because \contentsline is, but it is not currently documented in the user manual.

```
85 \newcommand*\fxcontentsline[2]{%
86  \begingroup%
87  \let\@dottedtocline\@fxdottedtocline%
88  \l@fixme{#1}{#2}%
89  \endgroup}
90
```

$fxaddcontentsline {(contents)}$

Wrapper around LATEX's \addcontentsline macro to handle the target option. If a specific target is provided, we can't use the normal \addcontentsline macro for reasons explained above, so we use our own version of \contentsline instead. This macro is at the user level because \addcontentsline is, but it is not currently documented in the user manual.

```
91 \newcommand*\fxaddcontentsline[1]{%
92 \ifthenelse{\equal{\cmdfx@note@target}{thepage}}{%
93 \addcontentsline{lox}{fixme}{#1}}{%
94 \addtocontents{lox}{\protect\fxcontentsline{#1}{\cmdfx@note@target}}}
95
```

6.3.2 List headers

FiXme recognizes the standard article, report and book classes, the AMS ones, and adapts the list header accordingly. It also detects when the package basictoc is loaded and uses it, which notably makes it compliant with the KOMA-Script classes as well. Otherwise, the standard article layout is used.

6.3.2.1 article version

```
\@lox@prtc@article
\@lox@psttc@article
96 \newcommand\@lox@prtc@article{%
97 \section*{\@fxlistfixmename%
98 \@mkboth{\MakeUppercase\@fxlistfixmename}{\MakeUppercase\@fxlistfixmename}}
99 \let\@lox@psttc@article\relax
100
```

6.3.2.2 report version

\@lox@prtc@report

\@lox@psttc@report 101 \newcommand\@lox@prtc@report{%

```
\if@twocolumn
102
      \@restonecoltrue\onecolumn
103
    \else
104
       \@restonecolfalse
105
106
     \fi
     \chapter*{\@fxlistfixmename%
107
       \@mkboth{\MakeUppercase\@fxlistfixmename}{\MakeUppercase\@fxlistfixmename}}}
108
109 \newcommand\@lox@psttc@report{\if@restonecol\twocolumn\fi}
110
```

6.3.2.3 book version

```
\@lox@prtc@book
112 \if@twocolumn
                    \@restonecoltrue\onecolumn
               113
                  \else
               114
                     \@restonecolfalse
               115
               116
                  \fi
                   \chapter*{\@fxlistfixmename%
               117
                     \@mkboth{\MakeUppercase\@fxlistfixmename}{\MakeUppercase\@fxlistfixmename}}}
               118
               119 \newcommand\@lox@psttc@book{\if@restonecol\twocolumn\fi}
               120
```

6.3.3 Status/class-dependent implementation

\lox@final In the new implementation of the draft mode below, we not only check that the
\lox@draft lox file exists, but also that it is not empty before actually typesetting anything.

```
121 \let\lox@final\relax
122
123 \newread\lox@file
124 \newif\iflox@typeset
125 \def\lox@eol{\par}
126 \newcommand\lox@draft{%
     \lox@typesetfalse%
127
     \openin\lox@file\jobname.lox\relax
128
     \ifeof\lox@file\else
129
130
       \read\lox@file to \lox@maybeeol
131
       \ifeof\lox@file
         \ifx\lox@maybeeol\lox@eol\else\lox@typesettrue\fi
132
133
       \else
         \lox@typesettrue
134
       \fi
135
136
     \fi
137
     \closein\lox@file
     \iflox@typeset\@lox@prtc\@starttoc{lox}\@lox@psttc\else\@starttoc{lox}\fi}
138
```

\lox@draft@ams The amsbook and amsart classes have the very ugly idea of redefining the \@starttoc macro to take two arguments. Therefore, I need to provide a specific version of the \listoffixmes macro:

```
139 \newcommand\lox@draft@ams{\@starttoc{lox}\@fxlistfixmename} 140
```

6.4 Faces

6.5 Annotation layouts

6.5.1 Layout modes

multiuser These options specify whether FiXme should function in standalone or collaborasingleuser tive mode, allowing the different layouts to tweak their output.

```
mode _{147} \ensuremath{\sc l} \
```

```
\ifthenelse{\equal{#1}{true}}{%
148
149
     \fx@mode@singleuserfalse}{%
150
     \fx@mode@singleusertrue}]{%
     mode}{multiuser}
151
152 \@fxdefineboolkey[%
   \ifthenelse{\equal{#1}{true}}{%
153
     \fx@mode@multiuserfalse}{%
154
     \fx@mode@multiusertrue}]{%
155
     mode}{singleuser}
156
158
```

6.5.2 Layout creation

Separating between "early" and "late" layouts is needed in starred context, that is, when we are using targeted commands or environments.

\@fxearlylayouts Comma-separated lists of available early and late layouts. \@fxlatelayouts 159 \let\@fxearlylayouts\empty 160 \let\@fxlatelayouts\empty $FXProvidesLayout {(name)}[(release information)]$ 161 \newcommand*\FXProvidesLayout[1]{\ProvidesPackage{fxlayout#1}} $\{\langle layout \rangle\}\{\langle layouts \rangle\}$ \@fxrecordlayoutmutex Record mutual exclusion between $\langle layout \rangle$ and the comma-separated list of $\langle layouts \rangle$. For each $\langle layout \rangle$, the mutual exclusion list is stored in $\classical{layout} \classical{layout} \classical$ 162 \newcommand*\@fxrecordlayoutmutex[2]{% \edef\@fxlts{\zap@space#2 \@empty}% 163 \def\@fxexpr{\@fxaddtolist{@fxlayout@#1@mutex}}% 164 165 \expandafter\@fxexpr\expandafter{\@fxlts}% \@for\@fxlt:=\@fxlts\do{\@fxaddtolist{@fxlayout@\@fxlt @mutex}{#1}}} 166

FiXme v4.5 (2019/01/03)

\@fxhandlelayoutmutex	$\{\langle layout \rangle\}$ Handle $\langle layout \rangle$'s mutual exclusion list.
	<pre>167 \newcommand*\@fxhandlelayoutmutex[1]{% 168 \ifthenelse{\boolean{fx@layout@#1}}{% 169 \def\@fxexpr{\@for\@fxlt:=}% 170 \expandafter\@fxexpr\csname @fxlayout@#1@mutex\endcsname\do{% 171 \@ifundefined{iffx@layout@\@fxlt}{}{% 172 \ifthenelse{\boolean{fx@layout@\@fxlt}{% 173 \@fxpkgwarning{% 174 #1 layout requested;\MessageBreak 175 turning \@fxlt\space layout off}% 176 \@nameuse{fx@layout@\@fxlt}{false}}{}}}}</pre>
\@FXRegisterLayout	$\{\langle when \rangle\} [\langle mutex \rangle] \{\langle name \rangle\} \{\langle funcname \rangle\}$ Register a new layout with FiXme. This currently involves creating the boolean layout option with an optional function argument, constructing the translation macro to call the actual layout macro, and updating the appropriate layout list (early or late). The translation macro can't be \let to the real one, because themes might want to redefine latter. An optional mutual exclusion list may also be given.
	<pre>178 \def\@FXRegisterLayout#1[#2]#3#4{% 179 \@fxkeyifundefined{layout}{#3}{% 180 \@fxrecordlayoutmutex{#3}{#2}% 181 \@fxdefineboolkey[\@fxhandlelayoutmutex{#3}]{layout}{#3}% 182 \expandafter\def\csname @fxlayout@#3\endcsname{#4}% 183 \@fxaddtolist{@fx#1layouts}{#3}}{% 184 \@fxpkgerror{layout '#3' already registered}{% 185 You have called \string\FXRegisterLayout\space with a name already 186 in use.\MessageBreak 187 If you want to modify an existing layout, renew its 188 command.\MessageBreak 189 Otherwise, you must choose a different name.}}}</pre>
\FXRegisterLayout	$\langle * \rangle [\langle mutex \rangle] \{\langle name \rangle\} \{\langle funcname \rangle\}$ And the use-level interface:
	<pre>190 \newcommand\FXRegisterLayout{% 191 \@ifstar{% 192 \@ifnextchar[%] 193 {\@FXRegisterLayout{early}}{\@FXRegisterLayout{early}[]}}{% 194 \@ifnextchar[%] 195 {\@FXRegisterLayout{late}}{\@FXRegisterLayout{late}[]}} 196</pre>
\FXDefineLayoutKey	Finally, the extension-level option creation interface: 197 \@fxdefineoptioninterface{layout}{Layout} 198
	6.5.3 Standard textual dispositions
\@fxtextstd	${\langle type \rangle} {\langle note \rangle} {\langle author \rangle}$ The standard text disposition.

199 \newcommand*\@fxtextstd[3]{\ignorespaces#3 \fxnotename{#1}: #2}

FiXme v4.5 (2019/01/03)

 $\ \ \left(author \right) \right)$

Typeset the signature part unless (*author*) is empty. Note that \ifthenelse is fragile, so we need to make the signature stuff robust. 200 \DeclareRobustCommand*\@fxsignature[1]{%

201 \ifthenelse{\equal{#1}}} $- { \starter{signature}#1}}$

\@fxsigstd {\langle type \} {\langle author \}
The standard signature disposition.
202 \newcommand*\@fxsigstd[3] {\fxnotename{#1}: #2\@fxsignature{#3}}

6.5.4 Built-in layouts

Let's start with the early layouts, and continue with the late ones.

6.5.4.1 Margin

margin 203 \@fxnewface{margin}

204 \newcommand*\FXLayoutMargin[3]{%

205 \marginpar[\raggedleft\@fxuseface{margin}\@fxtextstd{#1}{#2}{#3}]{% 206 \raggedright\@fxuseface{margin}\@fxtextstd{#1}{#2}{#3}}

\@fxlayout@margin

[no]margin 207 \FXRegisterLayout*{margin}{\FXLayoutMargin}

6.5.4.2 Margin clue

 $\{\langle type \rangle\}\{\langle note \rangle\}\{\langle author \rangle\}$

\FXLayoutMarginCLue 208 \newcommand*\FXLayoutMarginClue[3]{%

209 \marginpar[%

- 210 {\raggedleft\@fxuseface{margin}\ignorespaces#3 \fxnotename{#1}!}]{%
- 211 \raggedright\@fxuseface{margin}\ignorespaces#3 \fxnotename{#1}!}}

\@fxlayout@marginclue

[no]marginclue 212 \FXRegisterLayout*[margin]{marginclue}{\FXLayoutMarginClue}

6.5.4.3 Footnote

 $\{\langle type \rangle\}\{\langle note \rangle\}\{\langle author \rangle\}$

\FXLayoutFootnote 213 \newcommand*\FXLayoutFootnote[3]{\footnote{\@fxtextstd{#1}{#2}{#3}}}

\@fxlayout@footnote

[no]footnote 214 \FXRegisterLayout{footnote}{\FXLayoutFootnote}

6.5.4.4 Inline

inline 215 \@fxnewface{inline}

 $TLayoutInline {\langle type \rangle} {\langle note \rangle} {\langle author \rangle}$

216 \newcommand*\FXLayoutInline[3]{ $\fill fxuseface{inline}\fill fxtextstd{#1}{#2}{#3}}$

\@fxlayout@inline

[no]inline 217 \FXRegisterLayout{inline}{\FXLayoutInline}

6.5.4.5 Index

 $\timeindexname \ _{218} \timeindexname \ _{18} \timeindexname \ _{$

\@wrindex {\contents\}
 A replacement for LATEX's standard \@wrindex macro to deal with the target
 option. When given, it is supposed to replace the page number, just as in the list
 of fixmes.

```
219 def \ wrindex #1{%}
```

```
220 \ifthenelse{\equal{\cmdfx@note@target}{thepage}}{%
```

```
222 \protected@write\@indexfile{}{\string\indexentry{#1}{\cmdfx@note@target}}}%
```

223 $\ensuremath{\mathsf{endgroup}}$

224 $\ensuremath{\texttt{Qesphack}}$

fi

241

\@fxnotekey The keys used to sort indexed annotations by importance level:

```
\@fxwarningkey 225 \newcommand\@fxnotekey{***a}
  \@fxerrorkey 226 \newcommand\@fxwarningkey{***b}
  \@fxfatalkey 227 \newcommand\@fxerrorkey{***c}
                228 \mbox{newcommand}@fxfatalkey{***d}
FXLayoutIndex {\langle type \rangle}{\langle note \rangle}{\langle author \rangle}
                229 \newcommand*\FXLayoutIndex[3] {%
                     \iffx@mode@multiuser%
                230
                        \index{***@\fixmeindexname:%
                231

251
     \edef\@fxlts{\zap@space#1 \@empty}%
     \@for\@fxlt:=\@fxlts\do{\usepackage{fxlayout#1}}}
252
253
```

6.5.6 Layout control

 $\{\langle keys \rangle\}$ This macro would probably be overkill if we didn't need to \expandafter \@fxsetlayoutkeys it at some point (See \@fxhandleinnermode). 254 \newcommand\@fxsetlayoutkeys{\@fxsetkeys{layout}} \@fxparselayout Utility macro to detect the no(name) form of layout options. The drawback of this technique is that layout options must be at least 3 characters long. No big deal though... 255 \def\@fxparselayout#1#2#3\relax{\def\@fxltprefix{#1#2}\def\@fxltrest{#3}} 256 % \begin{macro}{\fxuselayouts} 257 % \marg{[no]names}\\ 258 % First, ensure that those layouts are available, then activate them. 259 % \cs{\FXRequireLayouts} is a better style for theme programming. 260 % \begin{macrocode} 261 \newcommand*\fxuselayouts[1]{% \edef\@fxlts{\zap@space#1 \@empty}% 262263\@for\@fxlt:=\@fxlts\do{% \expandafter\@fxparselayout\@fxlt\relax% 264\ifthenelse{\equal{\@fxltprefix}{no}}{% 265\let\@fxltname\@fxltrest}{% 266267\let\@fxltname\@fxlt}% \@fxkeyifundefined{layout}{\@fxltname}{\fxloadlayouts{\@fxltname}}{}% 268269\@fxsetkeys{layout}{#1}} 270 \let\FXRequireLayouts\fxuselayouts 271innerlayout The alternative inner mode layout:

272 \@fxdefinecmdkey{layout}{innerlayout}{}

- morelayout The morelayout option adds to the existing layout configuration. The implementation is trivial, as it simply boils down to calling \setkeys on its argument. There are several advantages in doing this.
 - 1. It is possible to disable a layout by using the no(*layout*) form. For example, morelayout={inline,nomargin} will work.
 - 2. A wrong layout name (for instance, misspelled) will trigger an xkeyval error.

273 \@fxdefinekey{layout}{morelayout}{\fxuselayouts{#1}}

layout The layout option lets the user specify exactly which ones she wants to use. Not very difficult to implement either: it works by first deactivating all layouts, and then activating the provided ones as before. Note that the use of the $no\langle layout \rangle$ form is valid but has no effect.

```
274 \@fxdefinekey{layout}{layout}{%
275 \edef\@fxlayouts{\@fxearlylayouts,\@fxlatelayouts}%
276 \@for\@fxlt:=\@fxlayouts\do{%
277 \@nameuse{fx@layout@\@fxlt}{false}}%
278 \fxuselayouts{#1}}
279
```

       FiXme Fatal Error: '#1'}}
373
374
```

\@fxlog@note
\@fxlog@warning
\@fxlog@error
\@fxlog@fatal

e In order for the generic note dispatcher to be able to call the logging macros (see section 6.9.3 on page 44), we need an easier translation mechanism from the r annotation type to the actual macro name. The translation macros in question 1 can't be \let to the real one, because users might want to redefine the actual log macros later.

```
375 \def\@fxlog@note{\FXLogNote}
376 \def\@fxlog@warning{\FXLogWarning}
377 \def\@fxlog@error{\FXLogError}
378 \def\@fxlog@fatal{\FXLogFatal}
379
```

6.8.2 Logging control

6.9 **FiXme** notes

6.9.1 Note parameters

fixmecount fixmecount maintains the total of all annotations, regardless of their level. Each
fxnotecount
note type also gets its own counter:
fxwarningcount
382 \newcounter{fixmecount}
fxerrorcount
383 \newcounter{fixmecount}
fxfatalcount
384 \newcounter{fixmerorcount}
385 \newcounter{fixerrorcount}
386 \newcounter{fixfatalcount}
387
author An annotation "author" allows to distinguish notes from different persons in collaborative mode.
388 \@fxdefinecmdkey{note}{author}{}

target An annotation "target" may replace the page number in the list of corrections or in the index (see also section 6.5.4.6 on page 37). 389 \@fxdefinecmdkey{note}{target}{

6.9.2 Layout dispatch

```
\@fxhandleinnermode
                              Handle the case where T<sub>F</sub>X is in inner mode. We use the alternative layout
                              provided by the innerlayout option, and we make sure to disable both the
                              margin and marginclue layout forms. This is done by appending nomargin and
                              nomarginclue to the inner layout value (this also renders nasty user settings harm-
                              less). Before that, we provide some informative message if risky layout forms were
                              active.
                             390 \newcommand\@fxhandleinnermode{%
                                  \ifinner%

    \@fxissuecommonlayouts
                              \{\langle type \rangle\}\{\langle note \rangle\}
                              Dispatch all mode-independent layouts (actually, "layout" is to be taken in a
                              slightly broader sense here). This macro executes all operations that need to be
                              performed regardless of the document status. This currently means logging the
                              annotations. Previously, this code also updated the lox file, but this could lead
                              to typesetting artifacts even in final mode (because of the whatsit introduced by
                              \write), which is highly undesirable, and besides, there's no point in keeping that
                              information up to date, since it won't be typeset. So from now on, the contents
                              lines are only generated in draft mode by \@@@fxnote@late@draft.

432
```

6.9.4 Standard version

```
\@fxpostconfigure
```

figure This macro is used in \@@fxnote@early below, after processing user options (even when there is none), to postconfigure some aspects of the annotations. Currently, this involves two things: setting the author to \fixmelogo if it still is fixme, and automatically tracking the current language if required (note that all other language options turn tracking off, meaning that one can override language tracking locally by providing a language explicitely). Since environments need the postconfiguration done sooner, they perform it themselves and rebind this macro to \relax.

```
433 \newcommand*\@fxpostconfigure{%
     \ifthenelse{\equal{\cmdfx@note@author}{fixme}}{%
434
       \@fxsetkeys{note}{author=\fixmelogo}}{}%
435
     \iffx@lang@langtrack%
436
       \@fxkeyifundefined{lang}{\languagename}{%
437
         \@fxpkgwarning{unknown language '\languagename';\MessageBreak
438
           falling back to \@fxdefaultlang}%
439
         \@fxsetkeys{lang}{\@fxdefaultlang}}{%
440
         \@fxsetkeys{lang}{\languagename}}
441
442
     \fi}
443
```

\@fxendgroup This macro is used in \@@fxnote@late below to close the group opened at the user level. Since environments need the group opened for a longer time, they rebind it to \relax and close the group themselves later on.

444 $let\@fxendgroup\endgroup$

Counters need to be updated regardless of the mode.

445	{\def\@@fxnote@ear]	.y#1#2{%

466
```

6.9.6 User-level interface generation

 $\ensuremath{\mathbb{Q}}$

This macro is used at the beginning of every user-level entry point (here for notes, and also in the environments section), to preconfigure some aspects of the annotations, before possibly processing options. Currently, this only involves presetting the note's author to the one specified in the call to **\FXRegisterAuthor**. This

however is not done for the built-in fixme author, because this one should honor a global setting.

```
467 \newcommand*\@fxpreconfigure[1]{%
468 \ifthenelse{\equal{#1}{fixme}}{\@fxsetkeys{note}{author=#1}}}
```

 $\ensuremath{\mathbb{C}}\$

This macro defines the user-level interface:

```
469 \newcommand*\@fxnewnotemacro[3]{%
     \expandafter\DeclareRobustCommand\csname #1#2\endcsname{%
470
471
       \begingroup%
472
         \@fxpreconfigure{#3}%
473
         \@ifstar{%
474
           \@ifnextchar[%]
           {\@fxsnote{#2}}{\@@fxsnote{#2}}}{%
475
           \@ifnextchar[%]
476
           {\@fxnote{#2}}{\@@fxnote{#2}}}}
477
```

6.10 **FiXme** environments

A FiXme environment's summary is laid out by the corresponding macro, but the inline layout is disabled. This is as easy as appending noinline to the end of the options list.

6.10.1 Status-dependent implementation

```
\@@@@fxbeginenv@final {\type}}
\@@@@fxbeginenv@draft In final mode, verbatim's comment environment is used to suppress output.

              \@fxbeginenv
                                                                                     \{\langle type \rangle\} [\langle options \rangle] \{\langle summary \rangle\} \{\langle text \rangle\}
                                                                                       Note the targetlayout family here.
                                                                                    501 \log\left(\frac{1}{2} + \frac{1}{2} + \frac{1}{2}
                                                                                                             \@fxsetkeys{mode,status,lang,log,note,face,layout,envlayout,targetlayout}{%
                                                                                    502
                                                                                                                        #2,noinline}%
                                                                                    503
                                                                                    504
                                                                                                             505
```

6.10.4 User-level interface generation

$\operatorname{constant} \{\langle prefix \rangle\} \{\langle type \rangle\} \{\langle author \rangle\}$

This macro defines the user-level interface. The ending macros are identical. Also, the environments close their own group, so we prevent \@@fxnote from doing so by temporarily rebinding \@fxendgroup to \relax.

```
506 \newcommand*\@fxnewnoteenvs[3]{%
507
     \expandafter\def\csname #1#2\endcsname{%
508
       \begingroup%
         \let\@fxendgroup\relax%
509
         \@fxpreconfigure{#3}%
510
         \@ifnextchar[%]
511
            {\@fxbeginenv{#2}}{\@@fxbeginenv{#2}}}
512
     \expandafter\def\csname end#1#2\endcsname{%
513
         \fill \mathbb{P}^{\pi^2}
514
       \endgroup}%
515
     \expandafter\long\expandafter\def\csname #1#2*\endcsname{%
516
       \begingroup%
517
518
         \let\@fxendgroup\relax%
519
         \@fxpreconfigure{#3}%
520
         \@ifnextchar[%]
            {\@fxbeginsenv{#2}}{\@@fxbeginsenv{#2}}}
521
     \expandafter\def\csname end#1#2*\endcsname{%
522
          \@fxendenv{#2}%
523
524
       \endgroup}}
525
```

6.11 **FiXme** authors

 $FXRegisterAuthor { ($ *cmdprefix* $)}{ ($ *name* $)}$

This macro creates the whole user-level interface for a particular author:

```
526 \newcommand*\FXRegisterAuthor[3]{%
```

```
528\@fxpkgerror{command prefix '#1' already in use}{%529You have called \string\FXRegisterAuthor\space with a command prefix
```

```
    already in use.\MessageBreak
```

```
531 Please choose another one.}}%
```

```
532 \@ifundefined{#2note}{}{%
```

```
533 \@fxpkgerror{environment prefix '#2' already in use}{%
```

```
534 You have called \string\FXRegisterAuthor\space with an environment
535 prefix already in use.\MessageBreak
```

```
536 Please choose another one.}}%
```

537 $\finite{macro{#1}{note}{#3}}$

```
538 \@fxnewnotemacro{#1}{warning}{#3}%
```

- 539 \@fxnewnotemacro{#1}{error}{#3}%
- 540 \@fxnewnotemacro{#1}{fatal}{#3}%
- 541 $\fill dfxnewnoteenvs{#2}{note}{#3}%$

```
542 \@fxnewnoteenvs{#2}{warning}{#3}%
```

```
543 \@fxnewnoteenvs{#2}{error}{#3}%
```

```
544 \fill = 12 {fatal}{#3}
```

```
545
```

 $\fi \ldots \fi \$ And we use it to create the $\mathsf{Fi}\mathsf{Xme}$ default user:

```
anfx...[*] 546 \FXRegisterAuthor{fx}{anfx}{fixme}
```

```
\fixme [\langle options \rangle] {\langle note \rangle}
Deprecate \fixme:
547 \DeclareRobustCommand\fixme{%
548 \@fxpkgwarning{\string\fixme\space is deprecated;\MessageBreak
549 please use \string\fxfatal\space instead}%
550 \fxfatal}
```

afixme Deprecate the afixme environment:

```
551 \def\afixme{%
552 \@fxpkgwarning{The 'afixme' environment is deprecated;\MessageBreak
553 please use 'anfxfatal' instead}%
554 \anfxfatal}
555 \let\endafixme\endanfxfatal
```

6.12 Internationalization

\@fxlanguages This macro lists all the supported languages, including aliases:

```
556 \newcommand*\@fxlanguages{%
557 english,french,francais,spanish,italian,german,ngerman,danish,croatian}
558
```

6.12.2 Language tracking

langtrack Whether to track the value of \languagename automatically: $629 \ (fxdefineboolkey{lang}{langtrack})$

defaultlang Which language to use when tracking leads to an unsuported language: 630 \def\@fxexpr{\@fxdefinechoicekey{lang}{defaultlang}[\@fxdefaultlang]}

> 631 \expandafter\@fxexpr\expandafter{\@fxlanguages}{} 632

Language options 6.12.3

lang Store the current language in \Ofxlang after having handled language aliases, and \@fxlang disable language tracking:

```
633 \def\@fxexpr{\@fxdefinechoicekey{lang}{lang}[\@fxlang]}
                                                        634 \expandafter\@fxexpr\expandafter{\@fxlanguages}{%
                                                                        \ifthenelse{\equal{#1}{francais}}{\def\@fxlang{french}}{%
                                                        635
                                                                              \ifthenelse{\equal{#1}{ngerman}}{\def\@fxlang{german}}{}%
                                                        636
                                                        637
                                                                        \@fxsetkeys{lang}{langtrack=false}}
                                                        638
                              english Create individual language options:
                                 french 639 \@for\@fxlg:=\@fxlanguages\do{
                           francais 640
                                                                       \def\@fxexprone{\@fxdefinevoidkey{lang}}
                                                                        \edef\@fxexprtwo{{\@fxlg}{\noexpand\@fxsetkeys{lang}{lang=\@fxlg}}}
                              spanish 641
                              italian ^{642}
                                                                       \expandafter\@fxexprone\@fxexprtwo}
                                 german ^{643}
                              ngerman
                                                          6.12.4 Language abstraction layer
                                 danish
croatian
                                                          Construct the "list of fixmes" title in a language dependent fashion:
                                                        644 \newcommand*\@fxlistfixmename{\@nameuse{\@fxlang listfixmename}}
                                                         \{\langle type \rangle\}
                  \fxnotename
               \fxnotesname
                                                       Construct the notes names in a language dependent fashion:
                                                        645 \mbox{mewcommand} \mbox{fxnotename[1]} \mbox{fx}\mbox{fx}\mbox{fxlang} \mbox{fname} \mbox{fx}\mbox{fxlang} \mbox{fname} \mbox{fx}\mbox{fxlang} \mbox{fname} \mbox{fx}\mbox{fxlang} \mbox{fname} \mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mbox{fx}\mb

6.15 Finale

6.15.1 Class-dependent settings

Currently, our class dependencies only matter in draft mode, so one could argue that it is not optimal to handle this here. However, it would be incorrect to do it in the draft option code because this option can be switched at any point in the document (remember that it is understood even by the annotation macros and environments) and the stuff below should only be executed once. Besides, \@ifclassloaded is an \@onlypreamble macro...

As documented, marginal notes are incompatible with the ACM SIG classes. Initially, I thought I would detect these classes and issue an error if marginal layout (or clue) is active. However, I changed my mind, because nothing prevents somebody to write a new class on top of these ones and authorize \marginpar back again. Normally these classes issue an error if \marginpar is used. However, the 2.3 / June 2007 versions are buggy and the error actually triggers a stack overflow in LATEX... (patch submitted). Oh boy, these classes are a mess.

                          \let\@lox@psttc\@lox@psttc@article}}}}
            683
```

This overrides any previous class-based settings but makes the list of corrections compliant with the KOMA-Script classes and any document using the tocbasic package.

```
684 \@ifpackageloaded{tocbasic}{%
685 \addtotoclist[fixme]{lox}%
686 \renewcommand\lox@draft{\listoftoc[\@fxlistfixmename]{lox}}}{}
```

6.15.2 Options Processing

First, we execute some options to initialize FiXme to something sensible, and then we process the user ones. Note the abscence of the theme family here.

```
687 \ExecuteOptionsX[fx] <%
```

688 mode, status, lang, log, note, face, layout, envlayout, targetlayout>{%

```
mode=singleuser,%
689
    status=final,%
690
    lang=english,%
691
692 langtrack=false,%
693 defaultlang=english,%
694 nosilent,%
    author=fixme,%
695
696 target=thepage,%
697 layout=margin,%
    innerlayout={layout=inline},%
698
699 envlayout=plain,%
700 targetlayout=plain,%
    inlineface=\bfseries,%
701
702 marginface=\footnotesize,%
    envface=\bfseries,%
703
     targetface=\itshape}
704
705 \ProcessOptionsX*[fx]<%
706
    mode,status,lang,log,note,face,layout,envlayout,targetlayout>
707
```

6.15.3 The \fxsetup macro

```
fxsetup {(options)}
```

The inevitable setup macro, extremely impressive yet as trivial as can be with the **xkeyval** package...\fxsetup is the only place where the theme family is processed.

```
708 \newcommand*\fxsetup[1]{%
709 \@fxsetkeys{%
710 mode,status,lang,log,note,face,layout,envlayout,targetlayout,theme}{%
711 #1}}
712
```

6.15.4 **FiXme** summary

Finally, output a summary giving the number of fixme notes at the end of the compilation:

```
713 \AtEndDocument{%
714
    \iffx@log@silent\else
715
       \GenericWarning{%
         (FiXme)\@spaces\@spaces}{%
716
         FiXme Summary: Number of notes: \thefxnotecount, \MessageBreak%
717
         Number of warnings: \thefxwarningcount,\MessageBreak%
718
         Number of errors: \thefxerrorcount, \MessageBreak%
719
         Number of fatal errors: \thefxfatalcount,\MessageBreak%
720
         Total: \thefixmecount\@gobble}%
721
    \fi}
722
723 (/fixme)
```

A.3 Target Layouts

Since target layouts don't include author information, they're orthogonal to (and hence usable in) prefix/signature display.

A.3.1 The changebar layout

changebar

```
903 (*fxtargetlayoutchangebar)
904 \NeedsTeXFormat{LaTeX2e}
905 \FXProvidesTargetLayout{changebar}
906
907 \RequirePackage{changebar}
908 \setlength{\changebarsep}{5pt}
909
910 \fxsetface{target}{}
```

 $FXTargetLayoutChangeBar { (target) }$

```
911 \newcommand\FXTargetLayoutChangeBar[2] {\cbstart\@fxuseface{target}#2\cbend}
```

\@fxtargetlayout@changebar

912 \FXRegisterTargetLayout{changebar}{\FXTargetLayoutChangeBar} 913 \langle /fxtargetlayoutchangebar \rangle

A.3.2 The color layout

color

```
914 (*fxtargetlayoutcolor)
915 \NeedsTeXFormat{LaTeX2e}
916 \FXProvidesTargetLayout{color}
917
918 \RequirePackage{color}
919 \definecolor{fxnote}{rgb}{0.0000, 0.6000, 0.0000}
920 \definecolor{fxwarning}{rgb}{1.0000, 0.5490, 0.0000}
921 \definecolor{fxerror}{rgb}{1.0000, 0.2706, 0.0000}
922 \definecolor{fxfatal}{rgb}{1.0000, 0.0000, 0.0000}
923
```

fxtarget

```
924 \definecolor{fxtarget}{rgb}{0.3725,0.6196,0.6275}
925
926 \fxsetface{target}{}
927
```

 $FXTargetLayoutColor { ($ *target* $) }$

928 \newcommand\FXTargetLayoutColor[2]{\@fxuseface{target}\color{fxtarget}#2}

\@fxtargetlayout@color

929 \FXRegisterTargetLayout{color}{\FXTargetLayoutColor}
930 \/fxtargetlayoutcolor>

A.3.3 The colorcb layout

colorcb

931 (*fxtargetlayoutcolorcb)
932 \NeedsTeXFormat{LaTeX2e}
933 \FXProvidesTargetLayout{colorcb}
934

```
935 \RequirePackage{color}
936
937 \RequirePackage[color]{changebar}
938 \setlength{\changebarsep}{5pt}
939
940 \fxsetface{target}{}
```

 $FXTargetLayoutColorCB { (<math>target$)}

```
941 \newcommand\FXTargetLayoutColorCB[2]{%
```

942 $\cbstart\cbcolor{fx#1}\@fxuseface{target}#2\cbend}$

\@fxtargetlayout@colorcb

```
943 \FXRegisterTargetLayout{colorcb}{\FXTargetLayoutColorCB}
944 \langle/fxtargetlayoutcolorcb\rangle
```

B Themes

B.1 The signature theme

signature

```
