Using LuaLTEX to typeset RTL text with reledpar

Abstract

This file provides an example of how to use reledpar and Lua $\mathbb{M}_{E}X$ to typeset a right to left text with its translation on the facing page¹.

As you can see, the switch to RTL convention is made *before* the pstart. It must be also called inside \eledsection.

For an example with XFETEX, look at parallel-column-two-languages.tex file.

 $^{^1 \}mbox{The text}$ was provided by Latechneuse at https://tex.stackexchange.com/q/227837/.
