# Chapter 1

## Overview of Features

Before using `tabulararray` package, it is better to know how to typeset simple text and math tables with traditional `tabular`, `tabularx` and `array` environments, because we will compare `tblr` environment from `tabulararray` package with these environments. You may read web pages on LaTeX tables on [LearnLaTeX](#) and [Overleaf](#) first.

### 1.1 Vertical Space

After loading `tabulararray` package in the preamble, we can use `tblr` environments to typeset tabulars and arrays. The name `tblr` is short for `tabulararray` or top-bottom-left-right. The following is our first example:

```
\begin{tabular}{lccr}
\hline
Alpha & Beta & Gamma & Delta \\
\hline
Epsilon & Zeta & Eta & Theta \\
\hline
Iota & Kappa & Lambda & Mu \\
\hline
\end{tabular}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

```
\begin{tblr}{lccr}
\hline
Alpha & Beta & Gamma & Delta \\
\hline
Epsilon & Zeta & Eta & Theta \\
\hline
Iota & Kappa & Lambda & Mu \\
\hline
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

You may notice that there is extra space above and below the table rows with `tblr` environment. This space makes the table look better. If you don't like it, you could use `\SetTblrInner` command:

```
\SetTblrInner{rowsep=0pt}
\begin{tblr}{lccr}
\hline
Alpha & Beta & Gamma & Delta \\
\hline
Epsilon & Zeta & Eta & Theta \\
\hline
Iota & Kappa & Lambda & Mu \\
\hline
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

But in many cases, this `rowsep` is useful:

```
$\begin{array}{rrr}
\hline
\frac{2}{3} & \frac{2}{3} & \frac{1}{3} \\
\frac{2}{3} & -\frac{1}{3} & -\frac{2}{3} \\
\frac{1}{3} & -\frac{2}{3} & -\frac{2}{3} \\
\hline
\end{array}$
```

$$\begin{array}{rrr}
\frac{2}{3} & \frac{2}{3} & \frac{1}{3} \\
\frac{2}{3} & -\frac{1}{3} & -\frac{2}{3} \\
\frac{1}{3} & -\frac{2}{3} & -\frac{2}{3} \\
\hline
\end{array}$$

```
$\begin{tblr}{rrr}
\hline
\frac{2}{3} & \frac{2}{3} & \frac{1}{3} \\
\frac{2}{3} & -\frac{1}{3} & -\frac{2}{3} \\
\frac{1}{3} & -\frac{2}{3} & -\frac{2}{3} \\
\hline
\end{tblr}$
```

$$\begin{array}{rrr}
\frac{2}{3} & \frac{2}{3} & \frac{1}{3} \\
\frac{2}{3} & -\frac{1}{3} & -\frac{2}{3} \\
\frac{1}{3} & -\frac{2}{3} & -\frac{2}{3} \\
\hline
\end{array}$$

Note that you can use `tblr` in both text and math modes.

## 1.2 Multiline Cells

It's quite easy to write multiline cells without fixing the column width in `tblr` environments: just enclose the cell text with braces and use `\\"` to break lines:

```
\begin{tblr}{|l|c|r|}
\hline
Left & {Center \\ Cent \\ C} & {Right \\ R} \\
\hline
{L \\ Left} & {C \\ Cent \\ Center} & R \\
\hline
\end{tblr}
```

Left	Center Cent C	Right R
L Left	C Cent Center	R

## 1.3 Cell Alignment

From time to time, you may want to specify the horizontal and vertical alignment of cells at the same time. `Tabulararray` package provides a `Q` column for this (In fact, `Q` column is the only primitive column, other columns are defined as `Q` columns with some options):

```
\begin{tblr}{|Q[l,t]|Q[c,m]|Q[r,b]|}
\hline
{Top Baseline \\ Left Left} & Middle Center & {Right Right \\ Bottom Baseline} \\
\hline
\end{tblr}
```

Top Baseline Left Left	Middle Center	Right Right Bottom Baseline
---------------------------	---------------	--------------------------------

Note that you can use more meaningful `t` instead of `p` for top baseline alignment. For some users who are familiar with word processors, these `t` and `b` columns are counter-intuitive. In `tabulararray` package, there are another two column types `h` and `f`, which will align cell text at the head and the foot, respectively:

```
\begin{tblr}{Q[h,4em]Q[t,4em]Q[m,4em]Q[b,4em]Q[f,4em]}
\hline
{row\\head} & {top\\line} & {middle} & {line\\bottom} & {row\\foot} \\
\hline
{row\\head} & {top\\line} & {11\\22\\mid\\44\\55} & {line\\bottom} & {row\\foot} \\
\hline
\end{tblr}
```

row head	top line	middle	line bottom	row foot
row head		11		
		22	line	
	top line	mid	bottom	
		44		row
		55		foot

## 1.4 Multirow Cells

The above `h` and `f` alignments are necessary when we write multirow cells with `\SetCell` command in `tabulararray`.

```
\begin{tabular}{|l|l|l|l|l|l}
\hline
\multirow[t]{4}{1.5cm}{Multirow Cell One} & Alpha &
\multirow[b]{4}{1.5cm}{Multirow Cell Two} & Alpha \\
& Beta & Beta \\
& Gamma & Gamma \\
& Delta & Delta \\
\hline
\end{tabular}
```

Multirow Cell One	Alpha Beta Gamma Delta	Multirow Cell Two	Alpha Beta Gamma Delta
----------------------	---------------------------------	----------------------	---------------------------------

```
\begin{tblr}{|l|l|l|l|l|}
\hline
\SetCell[r=4]{h,1.5cm} Multirow Cell One & Alpha &
\SetCell[r=4]{f,1.5cm} Multirow Cell Two & Alpha \\
& Beta & & Beta \\
& Gamma & & Gamma \\
& Delta & & Delta \\
\hline
\end{tblr}
```

Multirow Cell One	Alpha		Alpha	
	Beta		Beta	
	Gamma	Multirow Cell Two	Gamma	
	Delta		Delta	

Note that you don't need to load `multirow` package first, since `tabulararray` doesn't depend on it. Furthermore, `tabulararray` will always typeset decent multirow cells. First, it will set correct vertical middle alignment, even though some rows have large height:

```
\begin{tabular}{|l|m{4em}|}
\hline
\multirow[c]{4}{1.5cm}{Multirow} & Alpha \\
& Beta \\
& Gamma \\
& Delta Delta Delta \\
\hline
\end{tabular}
```

Multirow	Alpha
	Beta
	Gamma
	Delta
	Delta
	Delta

```
\begin{tblr}{|l|m{4em}|}
\hline
\SetCell[r=4]{m,1.5cm} Multirow & Alpha \\
& Beta \\
& Gamma \\
& Delta Delta Delta \\
\hline
\end{tblr}
```

Multirow	Alpha
	Beta
	Gamma
	Delta
	Delta
	Delta

Second, it will enlarge row heights if the multirow cells have large height, therefore it always avoids vertical overflow:

```
\begin{tabular}{|l|m{4em}|}
\hline
\multirow[c]{2}{1cm}{Line \\ Line \\ Line \\ Line} & Alpha \\
\cline{2-2}
& Beta \\
\hline
\end{tabular}
```

Line	Alpha
Line	Beta
Line	
Line	

```
\begin{tblr}{|l|m{4em}|}
\hline
\SetCell[r=2]{m,1cm} {Line \\ Line \\ Line \\ Line} & Alpha \\
\cline{2-2}
& Beta \\
\hline
\end{tblr}
```

Line	Alpha
Line	Beta
Line	
Line	

If you want to distribute extra vertical space evenly to two rows, you may use `vspan` option described in Chapter 3.

## 1.5 Multi Rows and Columns

It was a hard job to typeset cells with multiple rows and multiple columns. For example:

```
\begin{tabular}{|c|c|c|c|c|c|}
\hline
\multirow{2}{*}{2 Rows} & \multicolumn{2}{c|}{2 Columns} & \multicolumn{2}{c|}{\multirow{2}{*}{2 Rows 2 Columns}} \\
\cline{2-3} & 2-2 & 2-3 & \multicolumn{2}{c|}{\{} \\
& 2-2 & 2-3 & 3-4 & 3-5 \\
\hline
3-1 & 3-2 & 3-3 & 3-4 & 3-5 \\
\hline
\end{tabular}
```

2 Rows	2 Columns		2 Rows 2 Columns		
	2-2	2-3	3-4	3-5	
3-1	3-2	3-3			

With `tabulararray` package, you can set spanned cells with `\SetCell` command: within the optional argument of `\SetCell` command, option `r` is for rowspan number, and `c` for colspan number; within the mandatory argument of it, horizontal and vertical alignment options are accepted. Therefore it's much simpler to typeset spanned cells:

```
\begin{tblr}{|c|c|c|c|c|c|}
\hline
\SetCell[r=2]{c}{2 Rows} & \SetCell[c=2]{c}{2 Columns} & \SetCell[r=2,c=2]{c}{2 Rows 2 Columns} \\
\hline
& 2-2 & 2-3 & & \\
\hline
3-1 & 3-2 & 3-3 & 3-4 & 3-5 \\
\hline
\end{tblr}
```

2 Rows	2 Columns		2 Rows 2 Columns		
	2-2	2-3	3-4	3-5	
3-1	3-2	3-3			

Using `\multicolumn` command, the omitted cells **must** be removed. On the contrary, using `\multirow` command, the omitted cells **must not** be removed. `\SetCell` command behaves the same as `\multirow` command in this aspect.

With `tblr` environment, any `\hline` segments inside a spanned cell will be ignored, therefore we're free to use `\hline` in the above example. Also, any omitted cell will definitely be ignored when typesetting, no matter it's empty or not. With this feature, we could put row and column numbers into the omitted cells, which will help us to locate cells when the tables are rather complex:

```
\begin{tblr}{|l1|c|rr|}
\hline
\SetCell[r=3,c=2]{h} r=3 c=2 & 1-2 & \SetCell[r=2,c=3]{r} r=2 c=3 & 1-4 & 1-5 \\
2-1 & 2-2 & 2-3 & 2-4 & 2-5 \\
\hline
3-1 & 3-2 & MIDDLE & \SetCell[r=3,c=2]{f} r=3 c=2 & 3-5 \\
\hline
\SetCell[r=2,c=3]{l} r=2 c=3 & 4-2 & 4-3 & 4-4 & 4-5 \\
5-1 & 5-2 & 5-3 & 5-4 & 5-5 \\
\hline
\end{tblr}
```

r=3 c=2	r=2 c=3	
	MIDDLE	
r=2 c=3		r=3 c=2

## 1.6 Column Types

`Tabulararray` package supports all normal column types, as well as the extendable `X` column type, which first occurred in `tabularx` package and was largely improved by `tabu` package:

```
\begin{tblr}{|X[2,1]|X[3,1]|X[1,r]|X[r]|}
\hline
Alpha & Beta & Gamma & Delta \\
\hline
\end{tblr}
```

Alpha	Beta	Gamma	Delta
-------	------	-------	-------

Also, `X` columns with negative coefficients are possible:

```
\begin{tblr}{|X[2,1]|X[3,1]|X[-1,r]|X[r]|}
\hline
Alpha & Beta & Gamma & Delta \\
\hline
\end{tblr}
```

Alpha	Beta	Gamma	Delta
-------	------	-------	-------

We need the width to typeset a table with `X` columns. If unset, the default is `\linewidth`. To change the width, we have to first put all column specifications into `colspec={...}`:

```
\begin{tblr}{width=0.8\linewidth,colspec={|X[2,1]|X[3,1]|X[-1,r]|X[r]|}}
\hline
Alpha & Beta & Gamma & Delta \\
\hline
\end{tblr}
```

Alpha	Beta	Gamma	Delta
-------	------	-------	-------

You can define new column types with `\NewColumnType` command. For example, in `tabulararray` package, `b` and `X` columns are defined as special `Q` columns:

```
\NewColumnType{b}[1]{Q[b,wd=#1]}
\NewColumnType{X}[1][]{{Q[co=1,#1]}}
```

## 1.7 Row Types

Now that we have column types and `colspec` option, you may ask for row types and `rowspec` option. Yes, they are here:

```
\begin{tblr}{colspec={Q[l]Q[c]Q[r]},rowspec={|Q[t]|Q[m]|Q[b]|}}
{Alpha \& Alpha} & Beta & Gamma \\
Delta & Epsilon & {Zeta \& Zeta} \\
Eta & {Theta \& Theta} & Iota \\
\end{tblr}
```

Alpha	Beta	Gamma
Alpha		
<hr/>		
Delta	Epsilon	Zeta
		Zeta
<hr/>		
Theta		
Eta	Theta	Iota

Same as column types, `Q` is the only primitive row type, and other row types are defined as `Q` types with different options. It's better to specify horizontal alignment in `colspec`, and vertical alignment in `rowspec`, respectively.

Inside `rowspec`, `|` is the `hline` type. Therefore we need not to write `\hline` command, which makes table code cleaner.

## 1.8 Hlines and Vlines

Hlines and vlines have been improved too. You can specify the widths and styles of them:

```
\begin{tblr}{|l| [dotted] | [2pt] c | r | [solid] | [dashed] |}
\hline
One & Two & Three \\
\hline\hline [dotted]\hline
Four & Five & Six \\
\hline[dashed]\hline[1pt]
Seven & Eight & Nine \\
\hline
\end{tblr}
```

One	Two	Three
Four	Five	Six
Seven	Eight	Nine

## 1.9 Colorful Tables

To add colors to your tables, you need to load `xcolor` package first. `Tabulararray` package will also load `ninecolors` package for proper color contrast. First you can specify background option for `Q` rows/columns inside `rowspec`/`colspec`:

```
\begin{tblr}{colspec={lcr},rowspec={|Q[cyan7]|Q[azure7]|Q[blue7]|}}
Alpha & Beta & Gamma \\
Epsilon & Zeta & Eta \\
Iota & Kappa & Lambda \\
\end{tblr}
```

Alpha	Beta	Gamma
Epsilon	Zeta	Eta
Iota	Kappa	Lambda

```
\begin{tblr}{colspec={Q[l,brown7]Q[c,yellow7]Q[r,olive7]},rowspec={|Q|Q|Q|}}
Alpha & Beta & Gamma \\
Epsilon & Zeta & Eta \\
Iota & Kappa & Lambda \\
\end{tblr}
```

Alpha	Beta	Gamma
Epsilon	Zeta	Eta
Iota	Kappa	Lambda

Also you can use \SetRow or \SetColumn command to specify row or column colors:

```
\begin{tblr}{colspec={lcr},rowspec={|Q|Q|Q|}}
\SetRow{cyan7} Alpha & Beta & Gamma \\
\SetRow{azure7} Epsilon & Zeta & Eta \\
\SetRow{blue7} Iota & Kappa & Lambda \\
\end{tblr}
```

Alpha	Beta	Gamma
Epsilon	Zeta	Eta
Iota	Kappa	Lambda

```
\begin{tblr}{colspec={lcr},rowspec={|Q|Q|Q|}}
\SetColumn{brown7}
Alpha & \SetColumn{yellow7} Beta & \SetColumn{olive7} Gamma \\
& \SetColumn{olive7} Gamma \\
\SetRow{brown7} Epsilon & Zeta & Eta \\
Iota & Kappa & Lambda \\
\end{tblr}
```

Alpha	Beta	Gamma
Epsilon	Zeta	Eta
Iota	Kappa	Lambda

Hlines and vlines can also have colors:

```
\begin{tblr}{colspec={lcr},rowspec={|[2pt,green7]Q|[teal7]Q|[green7]Q|[3pt,teal7]}}
Alpha & Beta & Gamma \\
Epsilon & Zeta & Eta \\
Iota & Kappa & Lambda \\
\end{tblr}
```

Alpha	Beta	Gamma
Epsilon	Zeta	Eta
Iota	Kappa	Lambda

```
\begin{tblr}{colspec={|[2pt,violet5]1|[2pt,magenta5]c|[2pt,purple5]r|[2pt,red5]}}
Alpha & Beta & Gamma \\
Epsilon & Zeta & Eta \\
Iota & Kappa & Lambda \\
\end{tblr}
```

Alpha	Beta	Gamma
Epsilon	Zeta	Eta
Iota	Kappa	Lambda

# Chapter 2

## Basic Interfaces

### 2.1 Old and New Interfaces

With `tabulararray` package, you can change the styles of tables via old interfaces or new interfaces.

The old interfaces consist of some table commands inside the table contents. Same as `tabular` and `array` environments, all table commands **must** be put at the beginning of the cell text. Also, new table commands **must** be defined with `\NewTableCommand`.

The new interfaces consist of some options inside the mandatory argument, hence totally separating the styles and the contents of tables.

Table 2.1: Old Interfaces and New Interfaces

Old Interfaces	New Interfaces
<code>\SetHlines</code>	<code>hlines</code>
<code>\SetHline, \hline, \hborder, \cline</code>	<code>hline, hborder, rowspec</code>
<code>\SetVlines</code>	<code>vlines</code>
<code>\SetVline, \vline, \vborder, \rline</code>	<code>vline, vborder, colspec</code>
<code>\SetCells</code>	<code>cells</code>
<code>\SetCell</code>	<code>cell</code>
<code>\SetRows</code>	<code>rows</code>
<code>\SetRow</code>	<code>row, rowspec</code>
<code>\SetColumns</code>	<code>columns</code>
<code>\SetColumn</code>	<code>column, colspec</code>

### 2.2 Hlines and Vlines

All available keys for `hlines` and `vlines` are described in Table 2.2 and Table 2.3.

Table 2.2: Keys for Hlines

Key	Description and Values	Initial Value
<code>dash</code>	dash style: <code>solid</code> , <code>dashed</code> or <code>dotted</code>	<code>solid</code>
<code>text</code>	replace <code>hline</code> with text (like <code>!</code> specifier in <code>rowspec</code> )	<code>x</code>
<code>wd</code>	rule width dimension	<code>0.4pt</code>

Continued on next page

Table 2.2: Keys for Hlines (Continued)

Key	Description and Values	Initial Value
<u>fg</u>	rule color name	x
<u>leftpos</u>	crossing or trimming position at the left side	1
<u>rightpos</u>	crossing or trimming position at the right side	1
<u>endpos</u>	adjust leftpos/rightpos for only the leftmost/rightmost column	false

Note: In most cases, you can omit the underlined key names and write only their values.

Table 2.3: Keys for Vlines

Key	Description and Values	Initial Value
<u>dash</u>	dash style: solid, dashed or dotted	solid
<u>text</u>	replace vline with text (like ! specifier in colspec)	x
<u>wd</u>	rule width dimension	0.4pt
<u>fg</u>	rule color name	x
<u>abovepos</u>	crossing or trimming position at the above side	0
<u>belowpos</u>	crossing or trimming position at the below side	0

Note: In most cases, you can omit the underlined key names and write only their values.

### 2.2.1 Hlines and Vlines in New Interfaces

Options `hlines` and `vlines` are for setting all hlines and vlines, respectively. With empty value, all hlines/vlines will be solid.

```
\begin{tblr}{hlines,vlines}
Alpha & Beta & Gamma & Delta \\ 
Epsilon & Zeta & Eta & Theta \\
Iota & Kappa & Lambda & Mu \\
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

With values inside one pair of braces, all hlines/vlines will be styled.

```
\begin{tblr}{}
hlines = {1pt,solid}, vlines = {red3,dashed},
}
Alpha & Beta & Gamma & Delta \\
Epsilon & Zeta & Eta & Theta \\
Iota & Kappa & Lambda & Mu \\
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

Another pair of braces before will select segments in all hlines/vlines.

```
\begin{tblr}{}
vlines = {1,3,5}{dashed},
vlines = {2,4}{solid},
}
Alpha & Beta & Gamma & Delta \\
Epsilon & Zeta & Eta & Theta \\
Iota & Kappa & Lambda & Mu \\
Nu & Xi & Omicron & Pi \\
Rho & Sigma & Tau & Upsilon \\
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu
Nu	Xi	Omicron	Pi
Rho	Sigma	Tau	Upsilon

The above example can be simplified with `odd` and `even` values. (More child selectors can be defined with `\NewChildSelector` command. Advanced users could read the source code for this.)

```
\begin{tblr}{}
  vlines = {odd}{dashed},
  vlines = {even}{solid},
}
Alpha & Beta & Gamma & Delta \\ 
Epsilon & Zeta & Eta & Theta \\
Iota & Kappa & Lambda & Mu \\
Nu & Xi & Omicron & Pi \\
Rho & Sigma & Tau & Upsilon \\
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu
Nu	Xi	Omicron	Pi
Rho	Sigma	Tau	Upsilon

Another pair of braces before will draw more hlines/vlines (in which – stands for all line segments).

```
\begin{tblr}{}
  hlines = {1}{-}{dashed}, hlines = {2}{-}{solid},
}
Alpha & Beta & Gamma & Delta \\
Epsilon & Zeta & Eta & Theta \\
Iota & Kappa & Lambda & Mu \\
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

Note that you must use indexes in order: first 1, then 2, etc.

Options `hline{i}` and `vline{j}` are for setting some hlines and vlines, respectively. Their values are the same as options `hlines` and `vlines`:

```
\begin{tblr}{}
  hline{1,7} = {1pt,solid},
  hline{3-5} = {blue3,dashed},
  vline{1,5} = {3-4}{dotted},
}
Alpha & Beta & Gamma & Delta \\
Epsilon & Zeta & Eta & Theta \\
Iota & Kappa & Lambda & Mu \\
Nu & Xi & Omicron & Pi \\
Rho & Sigma & Tau & Upsilon \\
Phi & Chi & Psi & Omega \\
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu
Nu	Xi	Omicron	Pi
Rho	Sigma	Tau	Upsilon
Phi	Chi	Psi	Omega

You can use U, V, W, X, Y, Z to denote the last six children, respectively. It is especially useful when you are writing long tables:

```
\begin{tblr}{}
  hline{1,Z} = {2pt},
  hline{2,Y} = {1pt},
  hline{3-X} = {dashed},
}
Alpha & Beta & Gamma & Delta \\
Epsilon & Zeta & Eta & Theta \\
Iota & Kappa & Lambda & Mu \\
Nu & Xi & Omicron & Pi \\
Rho & Sigma & Tau & Upsilon \\
Phi & Chi & Psi & Omega \\
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu
Nu	Xi	Omicron	Pi
Rho	Sigma	Tau	Upsilon
Phi	Chi	Psi	Omega

Now we show the usage of `text` key by the following example<sup>1</sup>:

```
\begin{tblr}{%
    vlines, hlines,
    colspec = {lX[c]X[c]X[c]X[c]},
    vline{2} = {1}{text=\clap{:}},
    vline{3} = {1}{text=\clap{\ch{+}}},
    vline{4} = {1}{text=\clap{\ch{-}}},
    vline{5} = {1}{text=\clap{\ch{+}}},
}
Equation & \ch{CH4} & \ch{2 O2} & \ch{CO2} & \ch{2 H2O} \\
Initial & $n_1$ & $n_2$ & 0 & 0 \\
Final & $n_1-x$ & $n_2-2x$ & $x$ & $2x$ \\
\end{tblr}
```

Equation : CH <sub>4</sub> + 2 O <sub>2</sub> → CO <sub>2</sub> + 2 H <sub>2</sub> O				
Initial	$n_1$	$n_2$	0	0
Final	$n_1 - x$	$n_2 - 2x$	$x$	$2x$

You need to load `chemmacros` package for the `\ch` command.

The `leftpos` and `rightpos` keys specify crossing or trimming positions for `hlines`. The possible values for them are decimal numbers between `-1` and `1`. Their initial values are `1`.

- 
- 1 the hline is trimmed by `colsep`
  - 0 the hline only touches the first vline
  - 1 the hline touches all the vlines
- 

The `abovepos` and `belowpos` keys for `vlines` have similar meanings. But their initial values are `0`.

- 
- 1 the vline is trimmed by `rowsep`
  - 0 the vline only touches the first hline
  - 1 the vline touches all the hlines
- 

Here is an example for these four keys:

```
\begin{tblr}{%
    hline{1,4} = {1}{-}{},
    hline{1,4} = {2}{-}{},
    hline{2,3} = {1}{-}{leftpos = -1, rightpos = -1},
    hline{2,3} = {2}{-}{leftpos = -1, rightpos = -1},
    vline{1,4} = {abovepos = 1, belowpos = 1},
}
Alpha & Beta & Gamma \\
Epsilon & Zeta & Eta \\
Iota & Kappa & Lambda \\
\end{tblr}
```

Alpha	Beta	Gamma
Epsilon	Zeta	Eta
Iota	Kappa	Lambda

There is also an `endpos` option for adjusting `leftpos/rightpos` for only the leftmost/rightmost column:

<sup>1</sup> Code from <https://tex.stackexchange.com/questions/603023/tabulararray-and-tabularx-column-separator>.

```
\begin{tblr}{}
  hline{1,4} = {1}{-}{}, 
  hline{1,4} = {2}{-}{}, 
  hline{2,3} = {leftpos = -1, rightpos = -1, endpos}, 
  vline{1,4} = {abovepos = 1, belowpos = 1}, 
}
  Alpha & Beta & Gamma \\
  Epsilon & Zeta & Eta \\
  Iota & Kappa & Lambda \\
\end{tblr}
```

Alpha	Beta	Gamma
Epsilon	Zeta	Eta
Iota	Kappa	Lambda

## 2.2.2 Hlines and Vlines in Old Interfaces

The `\hline` command has an optional argument which accepts key-value options. The available keys are described in Table 2.2.

```
\begin{tblr}{llll}
\hline
  Alpha & Beta & Gamma & Delta \\
\hline[dashed]
  Epsilon & Zeta & Eta & Theta \\
\hline[dotted]
  Iota & Kappa & Lambda & Mu \\
\hline[2pt,blue5]
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

The `\cline` command also has an optional argument which is the same as `\hline`.

```
\begin{tblr}{llll}
\cline{1-4}
  Alpha & Beta & Gamma & Delta \\
\cline[dashed]{1,3}
  Epsilon & Zeta & Eta & Theta \\
\cline[dashed]{2,4}
  Iota & Kappa & Lambda & Mu \\
\cline[2pt,blue5]{-}
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

You can use child selectors in the mandatory argument of `\cline`.

```
\begin{tblr}{llll}
\cline{1-4}
  Alpha & Beta & Gamma & Delta \\
\cline[dashed]{odd}
  Epsilon & Zeta & Eta & Theta \\
\cline[dashed]{even}
  Iota & Kappa & Lambda & Mu \\
\cline[2pt,blue5]{-}
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

Commands `\SetHline` combines the usages of `\hline` and `\cline`:

```
\begin{tblr}{llll}
\SetHline{1-3}{blue5,1pt}
Alpha & Beta & Gamma & Delta \\
Epsilon & Zeta & Eta & Theta \\
Iota & Kappa & Lambda & Mu \\
\SetHline{2-4}{teal5,1pt}
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

```
\begin{tblr}{llll}
\begin{tblr}{llll}
\SetHline[1]{1-3}{blue5,1pt}
\SetHline[2]{1-3}{azure5,1pt}
Alpha & Beta & Gamma & Delta \\
Epsilon & Zeta & Eta & Theta \\
Iota & Kappa & Lambda & Mu \\
\SetHline[1]{2-4}{teal5,1pt}
\SetHline[2]{2-4}{green5,1pt}
\end{tblr}
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

In fact, table command `\SetHline[<index>]{<columns>}{<styles>}` at the beginning of row *i* is the same as table option `hline{i}=<index>{<columns>}{<styles>}`.

Also, table command `\SetHlines[<index>]{<columns>}{<styles>}` at the beginning of some row is the same as table option `hlines={<index>}{<columns>}{<styles>}`.

The usages of table commands `\vline`, `\rligne`, `\SetVline`, `\SetVlines` are similar to those of `\hline`, `\cline`, `\SetHline`, `\SetHlines`, respectively. But normally you don't need to use them.

## 2.3 Hborders and Vborders

Options `hborder{i}` and `vborder{j}` are similar to `hline{i}` and `vline{j}`, respectively, but they hold border specifications not related to one specific hline and vline. All available keys for `hborder{i}` and `vborder{j}` are described in Table 2.4 and Table 2.5.

Table 2.4: Keys for Hborders

Key	Description and Values	Initial Value
<code>pagebreak</code>	pagebreak at this position: <code>yes</code> , <code>no</code> or <code>auto</code> (See Chapter 4)	<code>auto</code>
<code>abovespace</code>	set <code>belowsep</code> of previous row (see Table 2.8)	<code>2pt</code>
<code>belowspace</code>	set <code>abovesep</code> of current row (see Table 2.8)	<code>2pt</code>
<code>abovespace+</code>	increase <code>belowsep</code> of previous row	<code>x</code>
<code>belowspace+</code>	increase <code>abovesep</code> of current row	<code>x</code>

Table 2.5: Keys for Vborders

Key	Description and Values	Initial Value
<code>leftspace</code>	set <code>rightsep</code> of previous column (see Table 2.9)	<code>6pt</code>
<code>rightspace</code>	set <code>leftsep</code> of current column (see Table 2.9)	<code>6pt</code>
<code>leftspace+</code>	increase <code>rightsep</code> of previous column	<code>x</code>
<code>rightspace+</code>	increase <code>leftsep</code> of current column	<code>x</code>

Furthermore, table command `\hborder{<specs>}` at the beginning of row *i* is the same as table option `hborder{i}=<specs>`, and table command `\vborder{<specs>}` at the beginning of column *j* is the same as table option `vborder{j}=<specs>`.

## 2.4 Cells and Spancells

All available keys for cells are described in Table 2.6 and Table 2.7.

Table 2.6: Keys for the Content of Cells

Key	Description and Values	Initial Value
<u>halign</u>	horizontal alignment: <code>l</code> (left), <code>c</code> (center), <code>r</code> (right) or <code>j</code> (justify)	<code>j</code>
<u>valign</u>	vertical alignment: <code>t</code> (top), <code>m</code> (middle), <code>b</code> (bottom), <code>h</code> (head) or <code>f</code> (foot)	<code>t</code>
<u>wd</u>	width dimension	×
<u>bg</u>	background color name	×
<u>fg</u>	foreground color name	×
<u>font</u>	font commands	×
<u>mode</u>	set cell mode: <code>math</code> , <code>imath</code> , <code>dmath</code> or <code>text</code>	×
<u>\$</u>	same as <code>mode=math</code>	×
<u>\$\$</u>	same as <code>mode=dmath</code>	×
<u>cmd</u>	execute command for the cell text	×
<u>preto</u>	prepend text to the cell	×
<u>appto</u>	append text to the cell	×

Note: In most cases, you can omit the underlined key names and write only their values.

Table 2.7: Keys for Multispan of Cells

Key	Description and Values	Initial Value
<code>r</code>	number of rows the cell spans	1
<code>c</code>	number of columns the cell spans	1

### 2.4.1 Cells and Spancells in New Interfaces

Option `cells` is for setting all cells.

```
\begin{tblr}{hlines={white},cellss={c,blue7}}
Alpha & Beta & Gamma & Delta \\
Epsilon & Zeta & Eta & Theta \\
Iota & Kappa & Lambda & Mu \\
Nu & Xi & Omicron & Pi \\
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu
Nu	Xi	Omicron	Pi

Option `cell{i}{j}` is for setting some cells, where `i` stands for the row numbers and `j` stands for the column numbers.

```
\begin{tblr}{}
cell{1}{2-4} = {cmd=\fbox}
}
Alpha & Beta & Gamma & Delta
\end{tblr}
```

Alpha Beta Gamma Delta

```
\begin{tblr}{}
    hlines = {white},
    vlines = {white},
    cell{1,6}{odd} = {teal7},
    cell{1,6}{even} = {green7},
    cell{2,4}{1,4} = {red7},
    cell{3,5}{1,4} = {purple7},
    cell{2}{2} = {r=4,c=2}{c,azure7},
}
Alpha & Beta & Gamma & Delta \\
Epsilon & Zeta & Eta & Theta \\
Iota & Kappa & Lambda & Mu \\
Nu & Xi & Omicron & Pi \\
Rho & Sigma & Tau & Upsilon \\
Phi & Chi & Psi & Omega \\
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Mu	Theta
Iota			Pi
Nu			Upsilon
Rho			
Phi	Chi	Psi	Omega

## 2.4.2 Cells and Spancells in Old Interfaces

The `\SetCell` command has a mandatory argument for setting the styles of current cell. The available keys are described in Table 2.6.

```
\begin{tblr}{|l|l|l|}
\hline[1pt]
Alpha & \SetCell{bg=teal2,fg=white} Beta & Gamma \\
\hline
Epsilon & Zeta & \SetCell{r,font=\scshape} Eta \\
\hline
Iota & Kappa & Lambda \\
\hline[1pt]
\end{tblr}
```

Alpha	Beta	Gamma
Epsilon	Zeta	ETA
Iota	Kappa	Lambda

The `\SetCell` command also has an optional argument for setting the multispans of current cell. The available keys are described in Table 2.7.

```
\begin{tblr}{|X|X|X|X|X|X|X|X|X|X|X|X|X|X|}
\hline
Alpha & Beta & Gamma & Delta & Epsilon & Zeta \\
\hline
\SetCell[c=2]{c} Eta & 2-2
& \SetCell[c=2]{c} Iota & 2-4
& \SetCell[c=2]{c} Lambda & 2-6 \\
\hline
\SetCell[c=3]{c} Nu & 3-2 & 3-3
& \SetCell[c=3]{c} Pi & 3-5 & 3-6 \\
\hline
\SetCell[c=6]{c} Tau & 4-2 & 4-3 & 4-4 & 4-5 & 4-6 \\
\hline
\end{tblr}
```

Alpha	Beta	Gamma	Delta	Epsilon	Zeta
Eta		Iota		Lambda	
Nu		Pi			
Tau					

```
\begin{tblr}{|X|X|X|X|X|X|X|X|X|X|X|}
\hline
Alpha & Beta & Gamma & Delta & Epsilon & Zeta \\
\hline
\SetCell[r=2]{m} Eta
& Theta & Iota & Kappa & Lambda & \SetCell[r=2]{m} Mu \\
\hline
Nu & Xi & Omicron & Pi & Rho & Sigma \\
\hline
\end{tblr}
```

Alpha	Beta	Gamma	Delta	Epsilon	Zeta
Eta	Theta	Iota	Kappa	Lambda	Mu
	Xi	Omicron	Pi	Rho	

In fact, table command `\SetCell[<span>]{<styles>}` at the beginning of cell at row i and column j is the same as table option `cell{i}{j}=<span>{<styles>}`.

Also, table command `\SetCells[<span>]{<styles>}` at the beginning of some cell is the same as table option `cells=<span>{<styles>}`.

## 2.5 Rows and Columns

All available keys for rows and columns are described in Table 2.8 and Table 2.9.

Table 2.8: Keys for Rows

Key	Description and Values	Initial Value
<u>halign</u>	horizontal alignment: <code>l</code> (left), <code>c</code> (center), <code>r</code> (right) or <code>j</code> (justify)	<code>j</code>
<u>valign</u>	vertical alignment: <code>t</code> (top), <code>m</code> (middle), <code>b</code> (bottom), <code>h</code> (head) or <code>f</code> (foot)	<code>t</code>
<u>ht</u>	height dimension	<code>x</code>
<u>bg</u>	background color name	<code>x</code>
<u>fg</u>	foreground color name	<code>x</code>
<u>font</u>	font commands	<code>x</code>
<u>mode</u>	set mode for row cells: <code>math</code> , <code>imath</code> , <code>dmath</code> or <code>text</code>	<code>x</code>
<u>\$</u>	same as <code>mode=math</code>	<code>x</code>
<u>\$\$</u>	same as <code>mode=dmath</code>	<code>x</code>
<u>cmd</u>	execute command for every cell text	<code>x</code>
<u>abovesep</u>	set vertical space above the row	<code>2pt</code>
<u>abovesep+</u>	increase vertical space above the row	<code>x</code>
<u>belowsep</u>	set vertical space below the row	<code>2pt</code>
<u>belowsep+</u>	increase vertical space below the row	<code>x</code>
<u>rowsep</u>	set vertical space above and below the row	<code>2pt</code>
<u>rowsep+</u>	increase vertical space above and below the row	<code>x</code>
<u>preto</u>	prepend text to every cell (like <code>&gt;</code> specifier in <code>rowspec</code> )	<code>x</code>
<u>appto</u>	append text to every cell (like <code>&lt;</code> specifier in <code>rowspec</code> )	<code>x</code>

*Note:* In most cases, you can omit the underlined key names and write only their values.

Table 2.9: Keys for Columns

Key	Description and Values	Initial Value
<u>halign</u>	horizontal alignment: <code>l</code> (left), <code>c</code> (center), <code>r</code> (right) or <code>j</code> (justify)	<code>j</code>
<u>valign</u>	vertical alignment: <code>t</code> (top), <code>m</code> (middle), <code>b</code> (bottom), <code>h</code> (head) or <code>f</code> (foot)	<code>t</code>
<u>wd</u>	width dimension	×
<u>co</u>	coefficient for the extendable column ( <code>X</code> column)	×
<u>bg</u>	background color name	×
<u>fg</u>	foreground color name	×
<u>font</u>	font commands	×
<u>mode</u>	set mode for column cells: <code>math</code> , <code>imath</code> , <code>dmath</code> or <code>text</code>	×
<u>\$</u>	same as <code>mode=math</code>	×
<u>\$\$</u>	same as <code>mode=dmath</code>	×
<u>cmd</u>	execute command for every cell text	×
<u>leftsep</u>	set horizontal space to the left of the column	<code>6pt</code>
<u>leftsep+</u>	increase horizontal space to the left of the column	×
<u>rightsep</u>	set horizontal space to the right of the column	<code>6pt</code>
<u>rightsep+</u>	increase horizontal space to the right of the column	×
<u>colsep</u>	set horizontal space to both sides of the column	<code>6pt</code>
<u>colsep+</u>	increase horizontal space to both sides of the column	×
<u>preto</u>	prepend text to every cell (like <code>&gt;</code> specifier in <code>colspec</code> )	×
<u>appto</u>	append text to every cell (like <code>&lt;</code> specifier in <code>colspec</code> )	×

Note: In most cases, you can omit the underlined key names and write only their values.

### 2.5.1 Rows and Columns in New Interfaces

Options `rows` and `columns` are for setting all rows and columns, respectively.

```
\begin{tblr}{  
    hlines, vlines,  
    rows = {7mm}, columns = {15mm,c},  
}  
    Alpha & Beta & Gamma & Delta \\  
    Epsilon & Zeta & Eta & Theta \\  
    Iota & Kappa & Lambda & Mu \\  
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

Options `row{i}` and `column{j}` are for setting some rows and columns, respectively.

```
\begin{tblr}{  
    hlines = {1pt,white},  
    row{odd} = {blue7},  
    row{even} = {azure7},  
    column{1} = {purple7,c},  
}  
Alpha & Beta & Gamma & Delta \\  
Epsilon & Zeta & Eta & Theta \\  
Iota & Kappa & Lambda & Mu \\  
Nu & Xi & Omicron & Pi \\  
Rho & Sigma & Tau & Upsilon \\  
Phi & Chi & Psi & Omega \\  
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu
Nu	Xi	Omicron	Pi
Rho	Sigma	Tau	Upsilon
Phi	Chi	Psi	Omega

The following example demonstrates the usages of `bg`, `fg` and `font` keys:

```
\begin{tblr}{  
    row{odd} = {bg=azure8},  
    row{1} = {bg=azure3, fg=white, font=\sffamily},  
}  
Alpha & Beta & Gamma \\  
Delta & Epsilon & Zeta \\  
Eta & Theta & Iota \\  
Kappa & Lambda & Mu \\  
Nu Xi Omicron & Pi Rho Sigma & Tau Upsilon Phi \\  
\end{tblr}
```

Alpha	Beta	Gamma
Delta	Epsilon	Zeta
Eta	Theta	Iota
Kappa	Lambda	Mu
Nu	Xi	Omicron
Pi	Rho	Sigma
Tau	Upsilon	Phi

The following example demonstrates the usages of `mode` key:

```
$\begin{tblr}{  
    column{1} = {mode=text},  
    column{3} = {mode=dmath},  
}  
\hline  
Alpha & \frac{1}{2} & \frac{1}{2} \\  
Epsilon & \frac{3}{4} & \frac{3}{4} \\  
Iota & \frac{5}{6} & \frac{5}{6} \\  
\hline  
\end{tblr}$
```

Alpha	$\frac{1}{2}$	$\frac{1}{2}$
Epsilon	$\frac{3}{4}$	$\frac{3}{4}$
Iota	$\frac{5}{6}$	$\frac{5}{6}$

The following example demonstrates the usages of `abovesep`, `belowsep`, `leftsep`, `rightsep` keys:

```
\begin{tblr}{}
    hlines, vlines,
    rows = {abovesep=1pt,belowsep=5pt},
    columns = {leftsep=1pt,rightsep=5pt},
}
Alpha & Beta & Gamma & Delta \\
Epsilon & Zeta & Eta & Theta \\
Iota & Kappa & Lambda & Mu \\
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

The following example shows that we can replace \\[dimen] with `belowsep+` key.

```
\begin{tblr}{}
    hlines, row{2} = {belowsep+=5pt},
}
Alpha & Beta & Gamma & Delta \\
Epsilon & Zeta & Eta & Theta \\
Iota & Kappa & Lambda & Mu \\
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

## 2.5.2 Rows and Columns in Old Interfaces

The `\SetRow` command has a mandatory argument for setting the styles of current row. The available keys are described in Table 2.8.

```
\begin{tblr}{llll}
\hline[1pt]
\SetRow{azure8} Alpha & Beta & Gamma & Delta \\
\hline
\SetRow{blue8,c} Epsilon & Zeta & Eta & Theta \\
\hline
\SetRow{violet8} Iota & Kappa & Lambda & Mu \\
\hline[1pt]
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

In fact, table command `\SetRow{<styles>}` at the beginning of row *i* is the same as table option `row{i}={<styles>}`.

Also, table command `\SetRows{<styles>}` at the beginning of some row is the same as table option `rows={<styles>}`.

The usages of table commands `\SetColumn` and `\SetColumns` are similar to those of `\SetRow` and `\SetRows`, respectively. But normally you don't need to use them.

## 2.6 Colspec and Rowspec

Options `colspec/rowspec` are for setting column/row specifications with column/row type specifiers.

### 2.6.1 Colspec and Width

Option `width` is for setting the width of the table with extendable columns. The following example demonstrates the usage of `width` option.

```
\begin{tblr}{width=0.8\textwidth, colspec={|1|X[2]|X[3]|X[-1]|}}
Alpha & Beta & Gamma & Delta \\
Epsilon & Zeta & Eta & Theta \\
Iota & Kappa & Lambda & Mu \\
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

You can omit `colspec` name if it is the only key you use inside the mandatory argument. The following example demonstrates the usages of `$` and `$$` keys:

```
\begin{tblr}{Q[1]Q[r,$]Q[r,$$]}
\hline
Alpha & \frac{1}{2} & \frac{1}{2} \\
Epsilon & \frac{3}{4} & \frac{3}{4} \\
Iota & \frac{5}{6} & \frac{5}{6} \\
\hline
\end{tblr}
```

Alpha	$\frac{1}{2}$	$\frac{1}{2}$
Epsilon	$\frac{3}{4}$	$\frac{3}{4}$
Iota	$\frac{5}{6}$	$\frac{5}{6}$

### 2.6.2 Column Types

The `tabulararray` package has only one type of primitive column: the `Q` column. Other types of columns are defined as `Q` columns with some keys.

```
\NewColumnType{1}{Q[1]}
\NewColumnType{c}{Q[c]}
\NewColumnType{r}{Q[r]}
\NewColumnType{t}[1]{Q[t,wd=#1]}
\NewColumnType{m}[1]{Q[m,wd=#1]}
\NewColumnType{b}[1]{Q[b,wd=#1]}
\NewColumnType{h}[1]{Q[h,wd=#1]}
\NewColumnType{f}[1]{Q[f,wd=#1]}
\NewColumnType{X}[1]{Q[co=1,#1]}
```

```
\begin{tblr}{|t{15mm}|m{15mm}|b{20mm}|}
Alpha & Beta & {Gamma}\Gamma \\
Epsilon & Zeta & {Eta}\Eta \\
Iota & Kappa & {Lambda}\Lambda \\
\end{tblr}
```

Alpha	Beta	Gamma
Epsilon	Zeta	Eta
Iota	Kappa	Lambda

Any new column type must be defined with `\NewColumnType` command. It can have an optional argument when it's defined.

### 2.6.3 Row Types

The `tabulararray` package has only one type of primitive row: the `Q` row. Other types of rows are defined as `Q` rows with some keys.

```
\NewRowType{l}{Q[l]}
\NewRowType{c}{Q[c]}
\NewRowType{r}{Q[r]}
\NewRowType{t}[1]{Q[t,ht=#1]}
\NewRowType{m}[1]{Q[m,ht=#1]}
\NewRowType{b}[1]{Q[b,ht=#1]}
\NewRowType{h}[1]{Q[h,ht=#1]}
\NewRowType{f}[1]{Q[f,ht=#1]}
```

```
\begin{tblr}{rowspec={|t{12mm}|m{10mm}|b{10mm}|}}
Alpha & Beta & {Gamma\\Gamma} \\
Epsilon & Zeta & {Eta\\Eta} \\
Iota & Kappa & {Lambda\\Lambda} \\
\end{tblr}
```

Alpha	Beta	Gamma
		Gamma
Epsilon	Zeta	Eta
		Eta
Iota	Kappa	Lambda
		Lambda

Any new row type must be defined with `\NewRowType` command. It can have an optional argument when it's defined.

# Chapter 3

## Extra Interfaces

In general, `tblr` environment can accept both inner and outer specifications:

```
\begin{tblr}[<outer specs>]{<inner specs>}  
  <table body>  
\end{tblr}
```

**Inner specifications** are all specifications written in the mandatory argument of `tblr` environment, which include new interfaces described in Chapter 2.

**Outer specifications** are all specifications written in the optional argument of `tblr` environment, most of which are used for long tables (see Chapter 4).

You can use `\SetTblrInner` and `\SetTblrOuter` commands to set default inner and outer specifications of tables, respectively (see Section 3.3).

### 3.1 Inner Specifications

In addition to new interfaces in Chapter 2, there are several inner specifications which are described in Table 3.1.

Table 3.1: Keys for Inner Specifications

Key	Description and Values	Initial Value
<code>rulesep</code>	space between two hlines or vlines	2pt
<code>stretch</code>	stretch ratio for struts added to cell text	1
<code>abovesep</code>	set vertical space above every row	2pt
<code>belowsep</code>	set vertical space below every row	2pt
<code>rowsep</code>	set vertical space above and below every row	2pt
<code>leftsep</code>	set horizontal space to the left of every column	6pt
<code>rightsep</code>	set horizontal space to the right of every column	6pt
<code>colsep</code>	set horizontal space to both sides of every column	6pt
<code>hspan</code>	horizontal span algorithm: <code>default</code> , <code>even</code> , or <code>minimal</code>	<code>default</code>
<code>vspan</code>	vertical span algorithm: <code>default</code> or <code>even</code>	<code>default</code>
<code>baseline</code>	set the baseline of the table	<code>m</code>

### 3.1.1 Space between Double Rules

The following example shows that we can replace `\doublerulesep` parameter with `rulesep` key.

```
\begin{tblr}{|
  colspec={||l|l|l|l||},
  rowspec={|Q|Q|Q|Q|},
  rulesep=4pt,
}
  Alpha & Beta & Gamma & Delta \\
  Epsilon & Zeta & Eta & Theta \\
  Iota & Kappa & Lambda & Mu \\
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

### 3.1.2 Minimal Strut for Cell Text

The following example shows that we can replace `\arraystretch` parameter with `stretch` key.

```
\begin{tblr}{hlines,stretch=1.5}
  Alpha & Beta & Gamma & Delta \\
  Epsilon & Zeta & Eta & Theta \\
  Iota & Kappa & Lambda & Mu \\
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

By replacing `stretch` with `row heights`, we can get perfect vertical centering for your numerical tables.

```
\begin{tblr}{hlines, stretch=0, rows={ht=\baselineskip}}
  2021 & 2022 & 2023 \\
  0.4 & 0.5 & 0.6 \\
  1.1 & 2.2 & 3.3 \\
\end{tblr}
```

2021	2022	2023
0.4	0.5	0.6
1.1	2.2	3.3

### 3.1.3 Rowseps and Colseps for All

The following example uses `rowsep` and `colsep` keys to set padding for all rows and columns.

```
\SetTblrInner{rowsep=2pt,colsep=2pt}
\begin{tblr}{hlines,vlines}
  Alpha & Beta & Gamma & Delta \\
  Epsilon & Zeta & Eta & Theta \\
  Iota & Kappa & Lambda & Mu \\
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

### 3.1.4 Hspan and Vspan Algorithms

With `hspan=default` or `hspan=even`, `tabulararray` package will compute column widths from span widths. But with `hspan=minimal`, it will compute span widths from column widths. The following examples show the results from different `hspan` values.

```
\SetTblrInner{hlines, vlines, hspan=default}
\begin{tblr}{cell{2}{1}={c=2}{1},cell{3}{1}={c=3}{1},cell{4}{2}={c=2}{1}}
  111 111 & 222 222 & 333 333 \\
  12 Multi Columns Multi Columns 12 & & 333 \\
  13 Multi Columns Multi Columns Multi Columns 13 & & \\
  111 & 23 Multi Columns Multi Columns 23 & \\
\end{tblr}
```

111 111	222 222	333 333
12 Multi Columns Multi Columns 12	333	
13 Multi Columns Multi Columns Multi Columns 13		
111	23 Multi Columns Multi Columns 23	

```
\SetTblrInner{hlines, vlines, hspan=even}
\begin{tblr}{cell{2}{1}={c=2}{1},cell{3}{1}={c=3}{1},cell{4}{2}={c=2}{1}}
  111 111 & 222 222 & 333 333 \\
  12 Multi Columns Multi Columns 12 & & 333 \\
  13 Multi Columns Multi Columns Multi Columns 13 & & \\
  111 & 23 Multi Columns Multi Columns 23 & \\
\end{tblr}
```

111 111	222 222	333 333
12 Multi Columns Multi Columns 12	333	
13 Multi Columns Multi Columns Multi Columns 13		
111	23 Multi Columns Multi Columns 23	

```
\SetTblrInner{hlines, vlines, hspan=minimal}
\begin{tblr}{cell{2}{1}={c=2}{1},cell{3}{1}={c=3}{1},cell{4}{2}={c=2}{1}}
  111 111 & 222 222 & 333 333 \\
  12 Multi Columns Multi Columns 12 & & 333 \\
  13 Multi Columns Multi Columns Multi Columns 13 & & \\
  111 & 23 Multi Columns Multi Columns 23 & \\
\end{tblr}
```

111 111	222 222	333 333
12 Multi Columns Multi Columns 12	333	
13 Multi Columns Multi Columns Multi Columns 13		
111	23 Multi Columns Multi Columns 23	

The following examples show the results from different `vspan` values.

```
\SetTblrInner{hlines, vlines, vspan=default}
\begin{tblr}{column{2}={3.25cm}, cell{2}{2}={r=3}{1}}
    Column1 & Column2 \\
    Row1 & Long text that needs multiple lines.
            Long text that needs multiple lines.
            Long text that needs multiple lines. \\
    Row2 & \\
    Row3 & \\
    Row4 & Short text \\
\end{tblr}
```

Column1	Column2
Row1	Long text that needs multiple lines. Long text that needs multiple lines. Long text that needs multiple lines.
Row2	
Row3	
Row4	Short text

```
\SetTblrInner{hlines, vlines, vspan=even}
\begin{tblr}{column{2}={3.25cm}, cell{2}{2}={r=3}{1}}
    Column1 & Column2 \\
    Row1 & Long text that needs multiple lines.
            Long text that needs multiple lines.
            Long text that needs multiple lines. \\
    Row2 & \\
    Row3 & \\
    Row4 & Short text \\
\end{tblr}
```

Column1	Column2
Row1	Long text that needs multiple lines. Long text that needs multiple lines. Long text that needs multiple lines.
Row2	
Row3	
Row4	Short text

### 3.1.5 Use Verbatim Commands

The inner key `verb` is obsolete from version 2023A, and will be removed in the future. Instead you can use more reliable `\fakeverb` command (see Section 6.2).

### 3.1.6 Set Baseline for the Table

With `baseline` key, you can set baseline for the table. All possible values for `baseline` are as follows:

t	
T	
m	
b	
B	
<n>	

If there is no hline above the first row, you get the same result with either `t` or `T`. But you get different results if there are one or more hlines above the row:

```
Baseline\begin{tblr}{hlines,baseline=t}
Alpha & Beta & Gamma \\
Epsilon & Zeta & Eta \\
Iota & Kappa & Lambda \\
\end{tblr}Baseline
```

Baseline	Baseline		
	Alpha	Beta	Gamma
	Epsilon	Zeta	Eta
	Iota	Kappa	Lambda

```
Baseline\begin{tblr}{hlines,baseline=T}
Alpha & Beta & Gamma \\
Epsilon & Zeta & Eta \\
Iota & Kappa & Lambda \\
\end{tblr}Baseline
```

Baseline	Alpha	Beta	Gamma	Baseline
	Epsilon	Zeta	Eta	
	Iota	Kappa	Lambda	

The differences between `b` and `B` are similar to `t` and `T`. In fact, these two values `T` and `B` are better replacements for currently obsolete `\firsthline` and `\lasthline` commands.

## 3.2 Outer Specifications

Except for specifications to be introduced in Chapter 4, there are several other outer specifications which are described in Table 3.2.

Table 3.2: Keys for Outer Specifications

Key	Description and Values	Initial Value
<code>baseline</code>	set the baseline of the table	<code>m</code>
<code>long</code>	change the table to a long table	<code>x</code>
<code>tall</code>	change the table to a tall table	<code>x</code>
<code>expand</code>	you need this key to use verb commands	<code>x</code>
<code>expand+</code>	like <code>expand</code> but appends to previous values	<code>x</code>

### 3.2.1 Set Baseline in Another Way

You may notice that you can write `baseline` option as either an inner or an outer specification. It is true that either way would do the job. But there is a small difference: when `baseline=t/T/m/b/B` is an outer specification, you can omit the key name and write the value only.

```
Baseline\begin{tblr}[m]{hlines}
Alpha & Beta & Gamma \\
Epsilon & Zeta & Eta \\
Iota & Kappa & Lambda \\
\end{tblr}Baseline
```

	Alpha	Beta	Gamma	
Baseline	Epsilon	Zeta	Eta	Baseline
	Iota	Kappa	Lambda	

### 3.2.2 Long and Tall Tables

You can change a table to long table by passing outer specification `long`, or change it to tall table by passing outer specification `tall` (see Chapter 4). Therefore the following two tables are the same:

```
\begin{longtblr}{lcr}
Alpha & Beta & Gamma
\end{longtblr}
\begin{tblr}[long]{lcr}
Alpha & Beta & Gamma
\end{tblr}
```

### 3.2.3 Expand Macros First

In contrast to traditional `tabular` environment, `tabulararray` environments need to see every `&` and `\\"` when splitting the table body with `l3regex`. And you can not put cell text inside any table command defined with `\NewTableCommand`. But you could use outer key `expand` to make `tabulararray` expand every occurrence of any of the specified macros once and in the given order before splitting the table body. Note that you can not expand a command defined with `\NewDocumentCommand`. You can also use `expand+` if you still want to keep the macros in the current `expand` setting.

To expand a command without optional argument, you can define it with `\newcommand`.

```
\newcommand*\tblrrowa{
  20 & 30 & 40 \\
}
\newcommand*\tblrrowb{
  50 & 60 & 70 \\
}
\newcommand*\tblrbody{
  \hline
  \tblrrowa
  \tblrrowb
  \hline
}
\SetTblrOuter{expand=\tblrbody\tblrrowa}
\begin{tblr}[expand+=\tblrrowb]{ccc}
  \hline
  AA & BB & CC \\
  20 & 30 & 40 \\
  50 & 60 & 70 \\
  \hline
  DD & EE & FF \\
  20 & 30 & 40 \\
  50 & 60 & 70 \\
  \hline
  GG & HH & II \\
  \hline
\end{tblr}
```

AA	BB	CC
20	30	40
50	60	70
DD	EE	FF
20	30	40
50	60	70
GG	HH	II

To expand commands with optional arguments, you can not define them with `\newcommand`. But you can define them with `\NewExpandableDocumentCommand`, and use option `expand=\expanded` to do exhaustive expansions.

```
\NewExpandableDocumentCommand\yes{0{Yes}m}{\SetCell{bg=green9}\#1}
\NewExpandableDocumentCommand\no{0{No}m}{\SetCell{bg=red9}\#1}
\begin{tblr}[expand=\expanded]{hlines}
  What I get & is below \\
  \expanded{\yes{}} & \expanded{\no{}} \\
  \expanded{\yes[Great]{}} & \expanded{\no[Bad]{}} \\
\end{tblr}
```

What I get	is below
Yes	No
Great	Bad

Note that you need to protect fragile commands (if any) inside them with `\unexpanded` command.

### 3.3 Default Specifications

`Tabulararray` package provides `\SetTblrInner` and `\SetTblrOuter` commands for you to change the default inner and outer specifications of tables.

In general different `tabulararray` environments (`tblr`, `talltblr`, `longtblr`, etc) could have different default specifications. You can list the environments in the optional arguments of these two commands, and they only apply to `tblr` environment when the optional arguments are omitted.

In the following example, the first line draws all `hlines` and `vlines` for all `tblr` tables created afterwards, while the second line makes all `tblr` tables created afterwards vertically align at the last row.

```
\SetTblrInner{hlines,vlines}
\SetTblrOuter{baseline=B}
```

And the following example sets zero `rowsep` for all `tblr` and `longtblr` tables created afterwards.

```
\SetTblrInner[tblr, longtblr]{rowsep=0pt}
```

## 3.4 New Tabulararray Environments

You can define new `tabulararray` environments using `\NewTblrEnviron` command:

```
\NewTblrEnviron{mytblr}
\SetTblrInner[mytblr]{hlines,vlines}
\SetTblrOuter[mytblr]{baseline=B}
Text \begin{mytblr}{cccc}
Alpha & Beta & Gamma & Delta \\
Epsilon & Zeta & Eta & Theta \\
Iota & Kappa & Lambda & Mu \\
\end{mytblr} Text
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

## 3.5 New General Environments

With `+b` argument type of `\NewDocumentEnvironment` command, you can also define a new general environment based on `tblr` environment (note that there is an extra pair of curly braces at the end):

```
\NewDocumentEnvironment{fancytblr}{+b}{
  Before Text
  \begin{tblr}{hlines}
    #1
  \end{tblr}
  After Text
}{}
```

```
\begin{fancytblr}
One & Two & Three \\
Four & Five & Six \\
Seven & Eight & Nine \\
\end{fancytblr}
```

Before Text	One	Two	Three	After Text
	Four	Five	Six	
	Seven	Eight	Nine	

## 3.6 New Table Commands

All commands which change the specifications of tables `must` be defined with `\NewTableCommand`. The following example demonstrates how to define a new table command:

```
\NewTableCommand\myhline{\hline[0.1em,red5]}
\begin{tblr}{llll}
\myhline
Alpha & Beta & Gamma & Delta \\
Epsilon & Zeta & Eta & Theta \\
Iota & Kappa & Lambda & Mu \\
\myhline
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

## 3.7 Odd and Even Selectors

From version 2022A, child selectors `odd` and `even` accept an optional argument, in which you can specify the start index and the end index of the children.

```
\begin{tblr}{}
  cell{odd}{1} = {red9},
  cell{odd[4]}{2} = {green9},
  cell{odd[3-X]}{3} = {blue9},
}

Head & Head & Head \\
Talk A & Place A & Date A \\
Talk B & Place B & Date B \\
Talk C & Place C & Date C \\
Talk D & Place D & Date D \\
Talk E & Place E & Date E \\
Talk F & Place F & Date F \\
Talk G & Place G & Date G \\
Talk H & Place H & Date H \\
\end{tblr}
```

Head	Head	Head
Talk A	Place A	Date A
Talk B	Place B	Date B
Talk C	Place C	Date C
Talk D	Place D	Date D
Talk E	Place E	Date E
Talk F	Place F	Date F
Talk G	Place G	Date G
Talk H	Place H	Date H

```
\begin{tblr}{}
  cell{even}{1} = {yellow9},
  cell{even[4]}{2} = {cyan9},
  cell{even[3-X]}{3} = {purple9},
}

Head & Head & Head \\
Talk A & Place A & Date A \\
Talk B & Place B & Date B \\
Talk C & Place C & Date C \\
Talk D & Place D & Date D \\
Talk E & Place E & Date E \\
Talk F & Place F & Date F \\
Talk G & Place G & Date G \\
Talk H & Place H & Date H \\
\end{tblr}
```

Head	Head	Head
Talk A	Place A	Date A
Talk B	Place B	Date B
Talk C	Place C	Date C
Talk D	Place D	Date D
Talk E	Place E	Date E
Talk F	Place F	Date F
Talk G	Place G	Date G
Talk H	Place H	Date H

## 3.8 Counters and Lengths

Counters `rownum`, `colnum`, `rowcount`, `colcount` can be used in cell text:

```
\begin{tblr}{hlines}
Cell[\arabic{rownum}][\arabic{colnum}] & Cell[\arabic{rownum}][\arabic{colnum}] &
Cell[\arabic{rownum}][\arabic{colnum}] & Cell[\arabic{rownum}][\arabic{colnum}] \\
Row=\arabic{rowcount}, Col=\arabic{colcount} &
Row=\arabic{rowcount}, Col=\arabic{colcount} &
Row=\arabic{rowcount}, Col=\arabic{colcount} &
Row=\arabic{rowcount}, Col=\arabic{colcount} \\
Cell[\arabic{rownum}][\arabic{colnum}] & Cell[\arabic{rownum}][\arabic{colnum}] &
Cell[\arabic{rownum}][\arabic{colnum}] & Cell[\arabic{rownum}][\arabic{colnum}] \\
\end{tblr}
```

Cell[1][1]	Cell[1][2]	Cell[1][3]	Cell[1][4]
Row=3, Col=4	Row=3, Col=4	Row=3, Col=4	Row=3, Col=4
Cell[3][1]	Cell[3][2]	Cell[3][3]	Cell[3][4]

Also, lengths `\leftsep`, `\rightsep`, `\abovesep`, `\belowsep` can be used in cell text.

## 3.9 Tracing Tabulararray

To trace internal data behind `tblr` environment, you can use `\SetTblrTracing` command. For example, `\SetTblrTracing{all}` will turn on all tracings, and `\SetTblrTracing{none}` will turn off all tracings. `\SetTblrTracing{+row,+column}` will only tracing row and column data. All tracing messages will be written to the log files.

# Chapter 4

## Use Long Tables

### 4.1 A Simple Example

To make a decent long table with header and footer, it is better to separate header/footer as `table head/foot` (which includes caption, footnotes, continuation text) and `row head/foot` (which includes some rows of the table that should appear in every page). By this approach, alternating row colors work as expected.

**Table 4.1: A Long Long Long Long Long Long Long Long Table**

Head	Head	Head
Head	Head	Head
Alpha	Beta	Gamma
Epsilon	Zeta <sup>a</sup>	Eta
Iota	Kappa <sup>†</sup>	Lambda
Nu	Xi	Omicron
Rho	Sigma	Tau
Phi	Chi	Psi
Alpha	Beta	Gamma
Epsilon	Zeta	Eta
Iota	Kappa	Lambda
Nu	Xi	Omicron
Rho	Sigma	Tau
Phi	Chi	Psi
Alpha	Beta	Gamma
Epsilon	Zeta	Eta
Iota	Kappa	Lambda
Nu	Xi	Omicron
Rho	Sigma	Tau
Phi	Chi	Psi
Alpha	Beta	Gamma
Epsilon	Zeta	Eta
Iota	Kappa	Lambda
Foot	Foot	Foot

Nu	Xi	Omicron
Foot	Foot	Foot

*Continued on next page*

The source code for the above long table is shown below. It is mainly self-explanatory.

```
\NewTblrTheme{fancy}{
  \SetTblrStyle{firsthead}{font=\bfseries}
  \SetTblrStyle{firstfoot}{fg=blue2}
  \SetTblrStyle{middlefoot}{\itshape}
  \SetTblrStyle{caption-tag}{red2}
}

\begin{longtblr}[
  theme = fancy,
  caption = {A Long Long Long Long Long Long Long Long Table},
  entry = {Short Caption},
  label = {tblr:test},
  note{a} = {It is the first footnote.},
  note{$\dag$} = {It is the second long long long long long long footnote.},
  remark{Note} = {Some general note. Some general note. Some general note.},
  remark{Source} = {Made up by myself. Made up by myself. Made up by myself.},
]{%
  colspec = {XXX}, width = 0.85\linewidth,
  rowhead = 2, rowfoot = 1,
  row{odd} = {gray9}, row{even} = {brown9},
  row{1-2} = {purple7}, row{Z} = {blue7},
}

\hline
Head & Head & Head \\ 
\hline
Head & Head & Head \\ 
\hline
Alpha & Beta & Gamma \\ 
\hline
Epsilon & Zeta\TblrNote{a} & Eta \\ 
\hline
Iota & Kappa\TblrNote{$\dag$} & Lambda \\ 
\hline
Nu & Xi & Omicron \\ 
\hline
Rho & Sigma & Tau \\ 
\hline
Phi & Chi & Psi \\ 
\hline
.....\\ 
\hline
Alpha & Beta & Gamma \\ 
\hline
Epsilon & Zeta & Eta \\ 
\hline
Iota & Kappa & Lambda \\ 
\hline
Nu & Xi & Omicron \\ 
\hline
Rho & Sigma & Tau \\ 
\hline
Phi & Chi & Psi \\ 
\hline
Foot & Foot & Foot \\ 
\hline
\end{longtblr}
```

As you can see in the above code, we typeset long tables with `longtblr` environment. And we can totally separate contents and styles of long tables with `tabulararray` package.

Row head and row foot consist of some lines of the table and should appear in every page. Their options are inner specifications and should be put in the mandatory argument of the `longtblr` environment. In the above example, We set `rowhead=2` and `rowfoot=1`.

Table 4.2: Inner Specifications for Row Heads and Row Foots

Key Name	Key Description	Initial Value
<code>rowhead</code>	number of the first rows of the table appear in every page	0
<code>rowfoot</code>	number of the last rows of the table appear in every page	0

Table head and table foot consist of the caption, continuation text, footnotes and remarks. Their options are outer specifications and should be put in the optional argument of the `longtblr` environment.

Table 4.3: Outer Specifications for Table Heads and Table Foots

Key Name	Key Description	Initial Value
<code>headsep</code>	vertical space between table head and table body	6pt
<code>footsep</code>	vertical space between table foot and table body	6pt
<code>presep</code>	vertical space between table head and the above text	1.5\bigskipamount
<code>postsep</code>	vertical space between table foot and the below text	1.5\bigskipamount
<code>theme</code>	table theme (including settings for templates and styles)	×
<code>caption</code>	table caption	×
<code>entry</code>	short table caption to be put in List of Tables	×
<code>label</code>	table label	×
<code>note{&lt;name&gt;}</code>	table note with <code>&lt;name&gt;</code> as tag	×
<code>remark{&lt;name&gt;}</code>	table remark with <code>&lt;name&gt;</code> as tag	×

If you write `entry=none`, `tabulararray` package will not add an entry in List of Tables. Therefore `caption=text,entry=none` is similar to `\caption[]{}{text}` in `longtable`.

If you write `label=none`, `tabulararray` package will not step table counter, and set the `caption-tag` and `caption-sep` elements (see below) to empty. Therefore `caption=text,entry=none,label=none` is similar to `\caption*{text}` in `longtable`, except for the counter.

## 4.2 Customize Templates

### 4.2.1 Overview of Templates

The template system for table heads and table foots in `tabulararray` is largely inspired by `beamer`, `caption` and `longtable` packages. For elements in Table 4.4, you can use `\DefTblrTemplate`<sup>1</sup> to define and modify templates, and use `\SetTblrTemplate` to choose default templates. In defining templates, you can include other templates with `\UseTblrTemplate` and `\ExpTblrTemplate` commands.

<sup>1</sup>From version 2022A, `\DefTblrTemplate` has another name `\DeclareTblrTemplate`.

Table 4.4: Elements for Table Heads and Table Foots

Element Name	Element Description and Default Template
contfoot-text	continuation text in the foot, normally “Continued on next page”
contfoot	continuation paragraph in the foot, normally including <code>contfoot-text</code> template
conthead-text	continuation text in the head, normally “(Continued)”
conthead	continuation paragraph in the head, normally including <code>conthead-text</code> template
caption-tag	caption tag, normally like “Table 4.2”
caption-sep	caption separator, normally like “: ”
caption-text	caption text, normally using user provided value
caption	including <code>caption-tag + caption-sep + caption-text</code>
note-tag	note tag, normally using user provided value
note-sep	note separator, normally like “ ”
note-text	note tag, normally using user provided value
note	including <code>note-tag + note-sep + note-text</code>
remark-tag	remark tag, normally using user provided value
remark-sep	remark separator, normally like “: ”
remark-text	remark text, normally using user provided value
remark	including <code>remark-tag + remark-sep + remark-text</code>
firsthead	table head on the first page, normally including <code>caption</code> template
middlehead	table head on middle pages, normally including <code>caption</code> and <code>conthead</code> templates
lasthead	table head on the last page, normally including <code>caption</code> and <code>conthead</code> templates
head	setting all of <code>firsthead</code> , <code>middlehead</code> and <code>lasthead</code>
firstfoot	table foot on the first page, normally including <code>contfoot</code> template
middlefoot	table foot on middle pages, normally including <code>contfoot</code> template
lastfoot	table foot on the last page, normally including <code>note</code> and <code>remark</code> templates
foot	setting all of <code>firstfoot</code> , <code>middlefoot</code> and <code>lastfoot</code>

An element which only includes short text is called a sub element. Normally there is one – in the name of a sub element. An element which includes one or more paragraphs is called a main element. Normally there isn’t any – in the name of a main element.

For each of the above elements, two templates `normal` and `empty` are always defined. You can select one of them with `\SetTblrTemplate` command.

## 4.2.2 Continuation Templates

Let us have a look at the code for defining templates of continuation text first:<sup>2</sup>

```
\DefTblrTemplate{contfoot-text}{normal}{Continued on next page}
\SetTblrTemplate{contfoot-text}{normal}
\DefTblrTemplate{conthead-text}{normal}{(Continued)}
\SetTblrTemplate{conthead-text}{normal}
```

In the above code, command `\DefTblrTemplate` defines the templates with name `normal`, and then command `\SetTblrTemplate` sets the templates with name `normal` as default. The `normal` template is always defined and set as default for any element in `tabulararray`. Therefore you had better use another name when defining new templates.

<sup>2</sup>To tell the truth, the default `conthead-text` and `contfoot-text` are actually stored in commands `\tblrcontheadname` and `\tblrcontfootname` respectively. And you may contribute your translations of them to `babel` package.

If you use `default` as template name in `\DefTblrTemplate`, you define and set it as default at the same time. Therefore the above code can be written in another way:

```
\DefTblrTemplate{contfoot-text}{default}{Continued on next page}
\DefTblrTemplate{conthead-text}{default}{(Continued)}
```

You may modify the code to customize continuation text to fit your needs.

The templates for `contfoot` and `conthead` normally include the templates of their sub elements with `\UseTblrTemplate` commands. But you can also handle user settings such as horizontal alignment here.

```
\DefTblrTemplate{contfoot}{default}{\UseTblrTemplate{contfoot-text}{default}}
\DefTblrTemplate{conthead}{default}{\UseTblrTemplate{conthead-text}{default}}
```

### 4.2.3 Caption Templates

Normally a caption consists of three parts, and their templates are defined with the follow code:

```
\DefTblrTemplate{caption-tag}{default}{Table\hspace{0.25em}\thetable}
\DefTblrTemplate{caption-sep}{default}{:\enskip}
\DefTblrTemplate{caption-text}{default}{\InsertTblrText{caption}}
```

The command `\InsertTblrText{caption}` inserts the value of `caption` key, which you could write in the optional argument of `longtblr` environment.

The `caption` template normally includes three sub templates with `\UseTblrTemplate` commands: The `caption` template will be used in `firsthead` template.

```
\DefTblrTemplate{caption}{default}{
  \UseTblrTemplate{caption-tag}{default}
  \UseTblrTemplate{caption-sep}{default}
  \UseTblrTemplate{caption-text}{default}
}
```

Furthermore `capcont` template includes `conthead` template as well. The `capcont` template will be used in `middlehead` and `lasthead` templates.

```
\DefTblrTemplate{capcont}{default}{
  \UseTblrTemplate{caption-tag}{default}
  \UseTblrTemplate{caption-sep}{default}
  \UseTblrTemplate{caption-text}{default}
  \UseTblrTemplate{conthead-text}{default}
}
```

### 4.2.4 Note and Remark Templates

The templates for table notes can be defined like this:

```
\DefTblrTemplate{note-tag}{default}{\textsuperscript{\InsertTblrNoteTag}}
\DefTblrTemplate{note-sep}{default}{\space}
\DefTblrTemplate{note-text}{default}{\InsertTblrNoteText}
```

```
\DefTblrTemplate{note}{default}{

  \MapTblrNotes{
    \noindent
    \UseTblrTemplate{note-tag}{default}
    \UseTblrTemplate{note-sep}{default}
    \UseTblrTemplate{note-text}{default}
    \par
  }
}
```

The `\MapTblrNotes` command loops for all table notes, which are written in the optional argument of `longtblr` environment. Inside the loop, you can use `\InsertTblrNoteTag` and `\InsertTblrNoteText` commands to insert current note tag and note text, respectively.

The definition of remark templates are similar to note templates.

```
\DefTblrTemplate{remark-tag}{default}{\InsertTblrRemarkTag}
\DefTblrTemplate{remark-sep}{default}{:\space}
\DefTblrTemplate{remark-text}{default}{\InsertTblrRemarkText}
```

```
\DefTblrTemplate{remark}{default}{

  \MapTblrRemarks{
    \noindent
    \UseTblrTemplate{remark-tag}{default}
    \UseTblrTemplate{remark-sep}{default}
    \UseTblrTemplate{remark-text}{default}
    \par
  }
}
```

#### 4.2.5 Head and Foot Templates

The templates for table heads and foots are defined as including other templates:

```
\DefTblrTemplate{firsthead}{default}{

  \UseTblrTemplate{caption}{default}
}

\DefTblrTemplate{middlehead,lasthead}{default}{

  \UseTblrTemplate{capcont}{default}
}

\DefTblrTemplate{firstfoot,middlefoot}{default}{

  \UseTblrTemplate{contfoot}{default}
}

\DefTblrTemplate{lastfoot}{default}{

  \UseTblrTemplate{note}{default}
  \UseTblrTemplate{remark}{default}
}
```

Note that you can define the same template for multiple elements in `\DefTblrTemplate` command. If you only want to show table caption in the first page, you may change the definitions of `middlehead` and `lasthead` elements:

```
\DefTblrTemplate{middlehead,lasthead}{default}{

  \UseTblrTemplate{conthead}{default}
}
```

## 4.3 Change Styles

All available keys for template elements are described in Table 4.5.

Table 4.5: Keys for the Styles of Elements

Key Name	Key Description	Initial Value
<u>fg</u>	foreground color	×
<u>font</u>	font commands	×
<u>halign</u>	horizontal alignment: l (left), c (center), r (right) or j (justify)	j
indent	parindent value	0pt
hang	hangindent value	0pt or 0.7em

Note: In most cases, you can omit the underlined key names and write only their values. The keys `halign`, `indent` and `hang` are only for main templates.

You may change the styles of elements with `\SetTblrStyle` command:

```
\SetTblrStyle{firsthead}{font=\bfseries}
\SetTblrStyle{firstfoot}{fg=blue2}
\SetTblrStyle{middlefoot}{\itshape}
\SetTblrStyle{caption-tag}{red2}
```

When you write `\UseTblrTemplate{element}{default}` in defining a template, beside including template code of the `element`, the foreground color and font commands of the `element` will be set up automatically. In contrast, `\ExpTblrTemplate{element}{default}` will only include template code.

## 4.4 Define Themes

You may define your own themes for table heads and foots with `\NewTblrTheme` command. a theme consists of some template and style settings. For example:

```
\NewTblrTheme{fancy}{
  \DefTblrTemplate{conthead}{default}{[Continued]}
  \SetTblrStyle{firsthead}{font=\bfseries}
  \SetTblrStyle{firstfoot}{fg=blue2}
  \SetTblrStyle{middlefoot}{\itshape}
  \SetTblrStyle{caption-tag}{red2}
}
```

After defining the theme `fancy`, you can use it by writing `theme=fancy` in the optional argument of `longtblr` environment.

## 4.5 Control Page Breaks

Just like `longtable` package, inside `longtblr` environment, you can use `\\"*` or `\nopagebreak` to prohibit a page break, and use `\pagebreak` to force a page break.

## 4.6 Floatable Tall Tables

There is also a `talltblr` environment as an alternative to `threeparttable` environment. It can not cross multiple pages, but it can be put inside `table` environment.

```

TEXT\begin{talltblr}[
  caption = {Long Long Long Long Tabular},
  entry = {Short Caption},
  label = {tblr:tall},
  note{a} = {It is the first footnote.},
  note{$\dag$} = {It is the second long long long long long long long footnote.},
]{}
  colspec = {XXX}, width = 0.5\linewidth, hlines,
}
  Alpha & Beta & Gamma \\
  Epsilon & Zeta & Eta\tblrNote{a} \\
  Iota & Kappa & Lambda\tblrNote{$\dag$} \\
\end{talltblr}TEXT

```

Table 4.6: Long Long Long Long Tabular

---

Alpha	Beta	Gamma
Epsilon	Zeta	Eta <sup>a</sup>
Iota	Kappa	Lambda <sup>†</sup>

---

<sup>a</sup> It is the first footnote.  
<sup>†</sup> It is the second long long long long long long long note.

# Chapter 5

## Use Some Libraries

The `tabulararray` package emulates or fixes some commands in other packages. To avoid potential conflict, you need to enable them with `\UseTblrLibrary` command.

### 5.1 Library `amsmath`

With `\UseTblrLibrary{amsmath}` in the preamble of the document, `tabulararray` will load `amsmath` package, and define `+array`, `+matrix`, `+bmatrix`, `+Bmatrix`, `+pmatrix`, `+vmatrix`, `+Vmatrix` and `+cases` environments. Each of the environments is similar to the environment without `+ prefix` in its name, but has default `rowsep=2pt` just as `tblr` environment. Every environment except `+array` accepts an optional argument, where you can write inner specifications.

```
$\begin{pmatrix}
\frac{2}{3} & \frac{2}{3} & \frac{1}{3} \\
\frac{2}{3} & \frac{1}{3} & \frac{2}{3} \\
\frac{1}{3} & -\frac{2}{3} & \frac{2}{3} \\
\frac{1}{3} & -\frac{3}{3} & \frac{1}{3}
\end{pmatrix}
```

$$\begin{pmatrix}
\frac{2}{3} & \frac{2}{3} & \frac{1}{3} \\
\frac{2}{3} & \frac{1}{3} & \frac{2}{3} \\
\frac{1}{3} & -\frac{2}{3} & \frac{2}{3} \\
\frac{1}{3} & -\frac{3}{3} & \frac{1}{3}
\end{pmatrix}$$

```
$\begin{pmatrix}[cells={r},row{2}=\color{purple}{8}]
\frac{2}{3} & \frac{2}{3} & \frac{1}{3} \\
\frac{2}{3} & \frac{1}{3} & \frac{2}{3} \\
\frac{1}{3} & -\frac{2}{3} & \frac{2}{3} \\
\frac{1}{3} & -\frac{3}{3} & \frac{1}{3}
\end{pmatrix}
```

$$\begin{pmatrix}
\frac{2}{3} & \frac{2}{3} & \frac{1}{3} \\
\frac{2}{3} & \frac{1}{3} & \frac{2}{3} \\
\frac{1}{3} & -\frac{2}{3} & \frac{2}{3} \\
\frac{1}{3} & -\frac{3}{3} & \frac{1}{3}
\end{pmatrix}$$

```
$f(x)=\begin{cases}
0, & x=1; \\
\frac{1}{3}, & x=2; \\
\frac{2}{3}, & x=3; \\
1, & x=4.
\end{cases}
```

$$f(x) = \begin{cases}
0, & x = 1; \\
\frac{1}{3}, & x = 2; \\
\frac{2}{3}, & x = 3; \\
1, & x = 4.
\end{cases}$$

```
$f(x)=\begin{cases}
0, & x=1; \\
\frac{1}{3}, & x=2; \\
\frac{2}{3}, & x=3; \\
1, & x=4.
\end{cases}
```

$$f(x) = \begin{cases}
0, & x = 1; \\
\frac{1}{3}, & x = 2; \\
\frac{2}{3}, & x = 3; \\
1, & x = 4.
\end{cases}$$

## 5.2 Library `booktabs`

With `\UseTblrLibrary{booktabs}` in the preamble of the document, `tabulararray` will load `booktabs` package, and define `\toprule`, `\midrule`, `\bottomrule` and `\cmidrule` inside `tblr` environment.

```
\begin{tblr}{llll}
\toprule
Alpha & Beta & Gamma & Delta \\
\midrule
Epsilon & Zeta & Eta & Theta \\
\cmidrule{1-3}
Iota & Kappa & Lambda & Mu \\
\cmidrule{2-4}
Nu & Xi & Omicron & Pi \\
\bottomrule
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu
Nu	Xi	Omicron	Pi

Just like `\hline` and `\cline` commands, you can also specify rule width and color in the optional argument of any of these commands.

```
\begin{tblr}{llll}
\toprule[2pt,purple3]
Alpha & Beta & Gamma & Delta \\
\midrule[blue3]
Epsilon & Zeta & Eta & Theta \\
\cmidrule[azure3]{2-3}
Iota & Kappa & Lambda & Mu \\
\bottomrule[2pt,purple3]
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

If you need more than one `\cmidrules`, you can use `\cmidrulemore` command.

```
\begin{tblr}{llll}
\toprule
Alpha & Beta & Gamma & Delta \\
\cmidrule{1-3} \cmidrulemore{2-4}
Epsilon & Zeta & Eta & Theta \\
\cmidrule{1-3} \morecmidrules \cmidrule{2-4}
Iota & Kappa & Lambda & Mu \\
\bottomrule
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

From version 2021N (2021-09-01), trim options (`l`, `r`, `lr`) for `\cmidrule` command are also supported.

```
\begin{tblr}{llll}
\toprule
Alpha & Beta & Gamma & Delta \\
\cmidrule[lr]{1-2} \cmidrule[lr=-0.4]{3-4}
Epsilon & Zeta & Eta & Theta \\
\cmidrule[r]{1-2} \cmidrule[l]{1}{3-4}
Iota & Kappa & Lambda & Mu \\
\bottomrule
\end{tblr}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

Note that you need to put `l`, `r` or `lr` option into the square brackets. and the possible values are decimal numbers between `-1` and `0`, where `-1` means trimming the whole colsep, and `0` means no trimming. The default value is `-0.8`, which makes similar result as `booktabs` package does.

There is also a `booktabs` environment for you. With this environment, the default `rowsep=0pt`, but extra

vertical space will be added by `\toprule`, `\midrule`, `\bottomrule` and `\cmidrule` commands. The sizes of vertical space are determined by `\aboverulesep` and `\belowrulesep` dimensions.

```
\begin{booktabs}{
  colspec = lcccc,
  cell{1}{1} = {r=2}{}, cell{1}{2,4} = {c=2}{},
}
\toprule
  Sample & I & II & \\
\cmidrule[lr]{2-3} \cmidrule[lr]{4-5}
  & A & B & C & D \\
\midrule
  S1 & 5 & 6 & 7 & 8 \\
  S2 & 6 & 7 & 8 & 5 \\
  S3 & 7 & 8 & 5 & 6 \\
\bottomrule
\end{booktabs}
```

Sample	I		II	
	A	B	C	D
S1	5	6	7	8
S2	6	7	8	5
S3	7	8	5	6

You can also use `\specialrule` command. The second argument sets `belowsep` of previous row, and the third argument sets `abovesep` of current row,

```
\begin{booktabs}[row{2}={olive9}]
\toprule
  Alpha & Beta & Gamma & Delta \\
\specialrule{0.5pt}{4pt}{6pt}
  Epsilon & Zeta & Eta & Theta \\
\specialrule{0.8pt,blue3}{3pt}{2pt}
  Iota & Kappa & Lambda & Mu \\
\bottomrule
\end{booktabs}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

At last, there is also an `\addlinespace` command. You can specify the size of vertical space to be added in its optional argument, and the default size is `0.5em`. This command adds one half of the space to `belowsep` of previous row, and the other half to `abovesep` of current row.

```
\begin{booktabs}[row{2}={olive9}]
\toprule
  Alpha & Beta & Gamma & Delta \\
\addlinespace
  Epsilon & Zeta & Eta & Theta \\
\addlinespace[1em]
  Iota & Kappa & Lambda & Mu \\
\bottomrule
\end{booktabs}
```

Alpha	Beta	Gamma	Delta
Epsilon	Zeta	Eta	Theta
Iota	Kappa	Lambda	Mu

From version 2022A (2022-03-01), there is a `longtabs` environment for writing long `booktabs` tables, and a `talltabs` environment for writing tall `booktabs` tables.

### 5.3 Library counter

You need to load `counter` library with `\UseTblrLibrary{counter}`, if you want to modify some LaTeX counters inside `tabulararray` tables.

```
\newcounter{mycnda}
\newcommand{\mycnda}{\stepcounter{mycnda}\arabic{mycnda}}
\begin{tblr}{hlines}
  \mycnda & \mycnda & \mycnda \\
  \mycnda & \mycnda & \mycnda \\
  \mycnda & \mycnda & \mycnda \\
\end{tblr}
```

1	2	3
4	5	6
7	8	9

## 5.4 Library diagbox

When writing `\UseTblrLibrary{diagbox}` in the preamble of the document, `tabulararray` package loads `diagbox` package, and you can use `\diagbox` and `\diagboxthree` commands inside `tblr` environment.

```
\begin{tblr}{hlines,vlines}
  \diagbox{Aa}{Pp} & Beta & Gamma \\
  Epsilon & Zeta & Eta \\
  Iota & Kappa & Lambda \\
\end{tblr}
```

Pp Aa	Beta	Gamma
Epsilon	Zeta	Eta
Iota	Kappa	Lambda

```
\begin{tblr}{hlines,vlines}
  \diagboxthree{Aa}{Pp}{Hh} & Beta & Gamma \\
  Epsilon & Zeta & Eta \\
  Iota & Kappa & Lambda \\
\end{tblr}
```

Pp Aa	Beta	Gamma
Epsilon	Zeta	Eta
Iota	Kappa	Lambda

You can also use `\diagbox` and `\diagboxthree` commands in math mode.

```
$\begin{tblr}{|c|cc|}
\hline
\diagbox{X_1}{X_2} & 0 & 1 \\
\hline
0 & 0.1 & 0.2 \\
1 & 0.3 & 0.4 \\
\hline
\end{tblr}$
```

X <sub>2</sub>	0	1
0	0.1	0.2
1	0.3	0.4

## 5.5 Library functional

With `\UseTblrLibrary{functional}` in the preamble of the document, `tabulararray` will load `functional` package, and define outer key `evaluate` and inner key `process`. These two new keys are useful for doing functional programming inside tables.

### 5.5.1 Outer key evaluate in action

With outer key `evaluate`, you can evaluate every occurrence of a specified protected function (defined with `\prgNewFunction`) and replace it with the return value before splitting the table body.

The first application of `evaluate` key is for inputting files inside tables. Assume you have two files `test1.tmp` and `test2.tmp` with the following contents:

```
\begin{filecontents*}[overwrite]{test1.tmp}
Some & Some \\
\end{filecontents*}
```

```
\begin{filecontents*}[overwrite]{test2.tmp}
Other & Other \\
\end{filecontents*}
```

Then you can input them with outer specification `evaluate=\fileInput`. The `\fileInput` function is provided by `functional` package.

```
\begin{tblr}[evaluate=\fileInput]{hlines}
Row1 & 1 \\
\fileInput{test1.tmp}
Row3 & 3 \\
\fileInput{test2.tmp}
Row5 & 5 \\
\end{tblr}
```

Row1	1
Some	Some
Row3	3
Other	Other
Row5	5

In general, you can define your functions which return parts of table contents, and use `evaluate` key to evaluate them inside tables.

```
\IgnoreSpacesOn
\prgNewFunction \someFunc {m} {
  \prgReturn {\#1 & #1 \\}
}
\IgnoreSpacesOff
\begin{tblr}[evaluate=\someFunc]{hlines}
Row1 & 1 \\
\someFunc{Text}
Row3 & 3 \\
\someFunc{Text}
Row5 & 5 \\
\end{tblr}
```

Row1	1
Text	Text
Row3	3
Text	Text
Row5	5

```
\IgnoreSpacesOn
\prgNewFunction \otherFunc {} {
  \prgReturn {Other & Other \\}
}
\IgnoreSpacesOff
\begin{tblr}[evaluate=\otherFunc]{hlines}
Row1 & 1 \\
\otherFunc
Row3 & 3 \\
\otherFunc
Row5 & 5 \\
\end{tblr}
```

Row1	1
Other	Other
Row3	3
Other	Other
Row5	5

You can even generate the whole table with some function.

```
\IgnoreSpacesOn
\prgNewFunction \makeEmptyTable {mm} {
  \tlSet \lTmpaTl {\intReplicate {\intEval{#2-1}} {&}}
  \tlPutRight \lTmpaTl {\\}
  \intReplicate {#1} {\tlUse \lTmpaTl}
}
\IgnoreSpacesOff
\begin{tblr}[evaluate=\makeEmptyTable]{hlines,vlines}
\makeEmptyTable{3}{7}
\end{tblr}
```

From version 2023A, you can evaluate all functions in the table body with option `evaluate=all`.

### 5.5.2 Inner key process in action

With inner key `process`, you can modify the contents and styles before the table is built. Several public functions defined with `\prgNewFunction` are provided for you:

- `\cellGetText{<rnum>}{<cnum>}`
- `\cellSetText{<rnum>}{<cnum>}{<text>}`
- `\cellSetStyle{<rnum>}{<cnum>}{<style>}`
- `\rowSetStyle{<rnum>}{<style>}`
- `\columnSetStyle{<cnum>}{<style>}`

As the first example, let's calculate the sums of cells column by column:

```
\IgnoreSpacesOn
\prgNewFunction \funcSum {} {
    \intStepOneInline {1} {\arabic{colcount}} {
        \intZero \lTmpaInt
        \intStepOneInline {1} {\arabic{rowcount}-1} {
            \intAdd \lTmpaInt {\cellGetText {####1} {##1}}
        }
        \cellSetText {\expWhole{\arabic{rowcount}}} {##1} {\intUse\lTmpaInt}
    }
}
\IgnoreSpacesOff
```

```
\begin{tblr}{colspec={rrr},process=\funcSum}
\hline
1 & 2 & 3 \\
4 & 5 & 6 \\
7 & 8 & 9 \\
\hline
& & \\
\hline
\end{tblr}
```

1	2	3
4	5	6
7	8	9
12	15	18

Now, let's set background colors of cells depending on their contents:

```
\IgnoreSpacesOn
\prgNewFunction \funcColor {} {
    \intStepOneInline {1} {\arabic{rowcount}} {
        \intStepOneInline {1} {\arabic{colcount}} {
            \intSet \lTmpaInt {\cellGetText {##1} {####1}}
            \intCompareTF {\lTmpaInt} > {0}
                {\cellSetStyle {##1} {####1} {bg=purple8}}
                {\cellSetStyle {##1} {####1} {bg=olive8}}
        }
    }
}
\IgnoreSpacesOff
```

```
\begin{tblr}{hlines,vlines,cells={r,$},process=\funcColor}
-1 & 2 & 3 \\
4 & 5 & -6 \\
7 & -8 & 9 \\
\end{tblr}
```

-1	2	3
4	5	-6
7	-8	9

We can also use color series of `xcolor` package to color table rows:

```
\definecolor{lightb}{RGB}{217,224,250}
\definecolorseries{tblrow}{rgb}{last}{lightb}{white}
\resetcolorseries[3]{tblrow}
\IgnoreSpacesOn
\prgNewFunction \funcSeries {} {
    \intStepOneInline {1} {\arabic{rowcount}} {
        \tlSet \lTmpaTl {\intMathMod {##1-1} {3}}
        \rowSetStyle {##1} {\expWhole{bg=tblrow!![\lTmpaTl]}}
    }
}
\IgnoreSpacesOff
```

```
\begin{tblr}{hlines,process=\funcSeries}
Row1 & 1 \\
Row2 & 2 \\
Row3 & 3 \\
Row4 & 4 \\
Row5 & 5 \\
Row6 & 6 \\
\end{tblr}
```

Row1	1
Row2	2
Row3	3
Row4	4
Row5	5
Row6	6

## 5.6 Library hook

This library is experimental, please see

<https://github.com/lvjr/tabulararray/wiki/HooksAndVariables>.

## 5.7 Library html

This library is experimental, please see

<https://github.com/lvjr/tabulararray/wiki/HooksAndVariables>.

## 5.8 Library nameref

From version 2022D, you can load `nameref` library to make `\nameref` and `\longtblr` work together.

## 5.9 Library siunitx

When writing `\UseTblrLibrary{siunitx}` in the preamble of the document, `tabulararray` package loads `siunitx` package, and defines S column as Q column with `si` key.

```
\begin{tblr}{%
    hlines, vlines,
    colspec={S[table-format=3.2]S[table-format=3.2]}
}
{{\Head}} & {{\Head}} \\
111 & 111 \\
2.1 & 2.2 \\
33.11 & 33.22 \\
\end{tblr}
```

Head	Head
111	111
2.1	2.2
33.11	33.22

```
\begin{tblr}{  
    hlines, vlines,  
    colspec={Q[si={table-format=3.2},c]Q[si={table-format=3.2},c]}  
}  
{{{{Head}}}} & {{{Head}}} \\  
    111 & 111 \\  
    2.1 & 2.2 \\  
    33.11 & 33.22 \\  
\end{tblr}
```

Head	Head
111	111
2.1	2.2
33.11	33.22

Note that you need to use triple pairs of curly braces to guard non-numeric cells. But it is cumbersome to enclose each cell with braces. From version 2022B (2022-06-01) a new key `guard` is provided for cells and rows. With `guard` key the previous example can be largely simplified.

```
\begin{tblr}{  
    hlines, vlines,  
    colspec={Q[si={table-format=3.2},c]Q[si={table-format=3.2},c]},  
    row{1} = {guard}  
}  
Head & Head \\  
111 & 111 \\  
2.1 & 2.2 \\  
33.11 & 33.22 \\  
\end{tblr}
```

Head	Head
111	111
2.1	2.2
33.11	33.22

Also you must use `l`, `c` or `r` to set horizontal alignment for non-numeric cells:

```
\begin{tblr}{  
    hlines, vlines, columns={6em},  
    colspec={  
        Q[si={table-format=3.2,table-number-alignment=left},l,blue7]  
        Q[si={table-format=3.2,table-number-alignment=center},c,teal7]  
        Q[si={table-format=3.2,table-number-alignment=right},r,purple7]  
    },  
    row{1} = {guard}  
}  
Head & Head & Head \\  
111 & 111 & 111 \\  
2.1 & 2.2 & 2.3 \\  
33.11 & 33.22 & 33.33 \\  
\end{tblr}
```

Head	Head	Head
111	111	111
2.1	2.2	2.3
33.11	33.22	33.33

Both `S` and `s` columns are supported. In fact, These two columns have been defined as follows:

```
\NewColumnType{S}[1][]{Q[si={#1},c]}  
\NewColumnType{s}[1][]{Q[si={#1},c,cmd=\TblrUnit]}
```

You don't need to and are not allowed to define them again.

## 5.10 Library `varwidth`

To build a nice table, `tabulararray` need to measure the widths of cells. By default, it uses `\hbox` to measure the sizes. This causes an error if a cell contains some vertical material, such as lists or display maths.

With `\UseTblrLibrary{varwidth}` in the preamble of the document, `tabulararray` will load `varwidth` package, and add a new inner specification `measure` for tables. After setting `measure=vbox`, it will use `\vbox` to measure cell widths.

```
\begin{tblr}{hlines,measure=vbox}
  Text Text Text Text Text Text Text
  \begin{itemize}
    \item List List List List List List
    \item List List List List List List
  \end{itemize}
  Text Text Text Text Text Text \\ 
\end{tblr}
```

Text Text Text Text Text Text
<ul style="list-style-type: none"> <li>• List List List List List</li> <li>• List List List List List</li> </ul>
Text Text Text Text Text Text

From version 2022A (2022-03-01), you can remove extra space above and below lists, by adding option `stretch=-1`. The following example also needs `enumitem` package and its `nosep` option:

<ul style="list-style-type: none"> <li>• List List List List</li> <li>• List List List List List</li> </ul>	oooo
<ul style="list-style-type: none"> <li>• List List List List</li> <li>• List List List List List</li> </ul>	gggg

```
\begin{tblr}{}
  hlines,vlines,rowspec={Q[l,t]Q[l,b]},
  measure=vbox,stretch=-1,
}
  \begin{itemize}[nosep]
    \item List List List List List
    \item List List List List List List
  \end{itemize} & oooo \\
  \begin{itemize}[nosep]
    \item List List List List List
    \item List List List List List List
  \end{itemize} & gggg \\
\end{tblr}
```

Note that option `stretch=-1` also removes struts from cells, therefore it may not work well in `tabulararray` environments with `rowsep=0pt`, such as `booktabs/longtabs/talltabs` environments from `booktabs` library.

## 5.11 Library `zref`

From version 2022D, you can load `zref` library to make `\zref` and `longtblr` work together.

# Chapter 6

## Tips and Tricks

### 6.1 Control Horizontal Alignment

You can control horizontal alignment of cells in `tabulararray` with `ragged2e` package, by redefining some of the following commands:

```
\RenewDocumentCommand\TblrAlignBoth{}{\justify}
\RenewDocumentCommand\TblrAlignLeft{}{\RaggedRight}
\RenewDocumentCommand\TblrAlignCenter{}{\Centering}
\RenewDocumentCommand\TblrAlignRight{}{\RaggedLeft}
```

Please read the documentation of `ragged2e` package for more details of their alignment commands.

### 6.2 Use Safe Verbatim Commands

Due to the limitation of TeX, even if you have passed `verb` option to a `tabulararray` table, you still could not use some special characters in a `\verb` command. As an replacement, you may use `\fakeverb` command from `codehigh` package.

The `\fakeverb` command will remove the backslashes in the following control symbols before typesetting its content: `\\", \\{, \\}, \\#, \\^` and `\\_`, `\\%`. Also the argument of `\fakeverb` command need to be enclosed with curly braces. Therefore it could be safely used inside `tabulararray` tables and other LaTeX commands.

Here is an example of using `\fakeverb` commands inside a `tblr` environment (you don't need `verb` option to use `\fakeverb`):

```
\begin{tblr}{hlines}
  Special & \fakeverb{\abc{}$&^_~uvw 123} \\
  Spacing & \fakeverb{\bfseries \ #\%} \\
  Nesting & \fbox{\fakeverb{$\left\\\right\$}}\\
\end{tblr}
```

Special	<code>\abc{}\$&amp;^_~uvw 123</code>
Spacing	<code>\bfseries #%</code>
Nesting	<code>\$\left\\\right\$</code>

In the above example, balanced curly braces and control words (such as `\bfseries`) need not to be escaped—only several special characters need to be escaped. Please read the documentation of `codehigh` package for more details of `\fakeverb` commands.<sup>1</sup>

<sup>1</sup>By the way, `\EscVerb` command from `fvextra` package is similar to `\fakeverb` command, but with `\EscVerb` you need to escape every control word.

# Chapter 7

## History and Future

### 7.1 The Future

Starting from 2022, except for hotfix releases for critical bugs, every new release will be published on the first day of some month. You may watch the milestones page for the scheduled dates of upcoming releases and their changes:

<https://github.com/lvjr/tabulararray/milestones>

To make the upcoming releases more stable, you are very welcome to test the latest package file in the repository. To test it, you only need to download the following `tabulararray.sty` and put it into the folder of your TeX documents:

<https://github.com/lvjr/tabulararray/raw/main/tabulararray.sty>

### 7.2 The History

The change log of `tabulararray` package will be updated on the wiki page:

<https://github.com/lvjr/tabulararray/wiki/ChangeLog>

In version 2023A, inner key `verb` was marked as obsolete, and it will be removed in the future. But don't worry too much, because you can stick to old version by `\usepackage{tabulararray} [=2023-03-01]`.

In version 2022A, there were several breaking changes:

- `\multicolumn` command was removed; it is better to use `\SetCell` command.
- `\multirow` command was removed; it is better to use `\SetCell` command.
- `\firsthline` command was removed; it is better to use `baseline=T` option.
- `\lasthline` command was removed; it is better to use `baseline=B` option.

For your old documents, you can still rollback to version 2021 by `\usepackage{tabulararray} [=v2021]`.
