GOST R 34.11-2012: Hash Function

Abstract

This document is intended to be a source of information about the Russian Federal standard hash function (GOST R 34.11-2012), which is one of the Russian cryptographic standard algorithms (called GOST algorithms). This document updates RFC 5831.

Status of This Memo

This document is not an Internet Standards Track specification; it is published for informational purposes.

This is a contribution to the RFC Series, independently of any other RFC stream. The RFC Editor has chosen to publish this document at its discretion and makes no statement about its value for implementation or deployment. Documents approved for publication by the RFC Editor are not a candidate for any level of Internet Standard; see Section 2 of RFC 5741.

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at <http://www.rfc-editor.org/info/rfc6986>.

1. Scope

The Russian Federal standard hash function (GOST R 34.11-2012) establishes the hash-function algorithm and the hash-function calculation procedure for any sequence of binary symbols used in cryptographic methods of information processing and information security, including techniques for providing data integrity and authenticity and for digital signatures during information transfer, information processing, and information storage in computer-aided systems.

The hash function defined in the standard provides for the operation of digital signature systems using the asymmetric cryptographic algorithm in compliance with GOST R 34.10-2012 [GOST3410-2012].

GOST R 34.11-2012 applies to the creation, operation, and modernization of information systems of different purpose.

GOST R 34.11-94 is superseded by GOST R 34.11-2012 from 1st January 2013. That means that all new systems that are presented for certification MUST use GOST R 34.11-2012 and MAY use GOST R 34.11-94 also for maintaining compatibility with existing systems. Usage of GOST R 34.11-94 in current systems is allowed at least for a 5-year period.

This document updates RFC 5831 [RFC5831].

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [RFC2119].

2. General Information

1. GOST R 34.11-2012 [GOST3411-2012] was developed by the Center for Information Protection and Special Communications of the Federal Security Service of the Russian Federation with participation of the open joint-stock company Information Technologies and Communication Systems (InfoTeCS JSC).
2. GOST R 34.11-2012 was approved and introduced by Decree #216 of the Federal Agency on Technical Regulating and Metrology on 07.08.2012.
3. GOST R 34.11-2012 is intended to replace GOST R 34.11-94 [GOST3411-94], a national standard of the Russian Federation.

Terms and concepts in the standard comply with the following international standards:

- o ISO 2382-2 [ISO2382-2],
- o ISO/IEC 9796 [ISO/IEC9796-2][ISO/IEC9796-3],
- o series of standards ISO/IEC 14888 [ISO/IEC14888-1] [ISO/IEC14888-2][ISO/IEC14888-3][ISO/IEC14888-3Amd], and
- o series of standards ISO/IEC 10118 [ISO/IEC10118-1][ISO/IEC10118-2][ISO/IEC10118-3][ISO/IEC10118-4].

3. Standard References

The following standards are referred to in GOST R 34.11-2012:

1. GOST 28147-89 [GOST28147-89], "Systems of information processing. Cryptographic data security. Algorithms of cryptographic transformation."

2. GOST R 34.10-2012 [GOST3410-2012], "Information technology. Cryptographic data security. Formation and verification processes of [electronic] digital signature."

Note: Users of the standard may check the validity of the referenced standards on the official Internet site of the Federal Agency on Technical Regulating and Metrology, in the annual reference book "National Standards" published on January 1 of the current year, and in corresponding monthly indices published during the current year. If the referenced standard is replaced (amended), then the replaced (amended) standard shall be used. If the referenced standard is canceled without replacement, then only the parts of this document not containing the specified reference may be used.

4. Definitions and Notations

The following terms and their corresponding definitions are used in the standard.

4.1. Definitions

padding: appending extra bits to a data string (Clause 3.9 of [ISO/IEC10118-1]).

initializing value: a value used in defining the starting point of a hash function (Clause 3.7 of [ISO/IEC10118-1]).

message: string of bits of any length (Clause 3.10 of [ISO/IEC14888-1]).

round function: a function that transforms two binary strings of lengths L1 and L2 to a binary string of length L2. It is used iteratively as part of a hash function, where it combines a data string of length L1 with the previous output of length L2 (Clause 3.10 of [ISO/IEC10118-1]).

Note: In GOST R 34.11-2012, the concepts "string of bits of length L" and "binary row vector of length L" are identical.

hash code: string of bits that is the output of a hash function (Clause 3.6 of [ISO/IEC14888-1]).

collision-resistant hash function: function that maps strings of bits to fixed-length strings of bits, satisfying the following properties:

1. for a given output, it is computationally infeasible to find an input that maps to this output;

2. for a given input, it is computationally infeasible to find a second input that maps to the same output; and
3. it is computationally infeasible to find any two distinct inputs that map to the same output (Clauses 3.2 and 3.7 of [ISO/IEC14888-1]).

Note: In the standard (to provide terminological compatibility with the current native standard documentation and with the published scientific and technical works), the terms "hash function" and "cryptographic hash function" are synonyms.

signature: one or more data elements resulting from the signature process (Clause 3.12 of [ISO/IEC 14888-1]).

Note: In the standard (to provide terminological compatibility with the current native standard documentation and with the published scientific and technical works), the terms "digital signature", "electronic signature", and "electronic digital signature" are synonyms.

4.2. Notations

The following notations are used in the standard:

V^*	the set of all binary row vectors of finite length (hereinafter referred to as vectors) including empty string
$ A $	the length (number of components) of the vector A belonging to V^* (if A is an empty string, then $ A = 0$)
V_n	the set of all binary vectors of length n, where n is a non-negative integer; subvectors and vector components are enumerated from right to left starting from zero
(xor)	exclusive-or of the two binary vectors of the same length
$A \mid B$	concatenation of vectors A, B (both belong to V^*), i.e., a vector from $V_{(A + B)}$, where the left subvector from $V_{(A)}$ is equal to the vector A and the right subvector from $V_{(B)}$ is equal to the vector B
A^n	concatenation of n instances of the vector A
$Z_{(2^n)}$	ring of residues modulo 2^n
$[+]$	addition operation in the ring $Z_{(2^n)}$

Vec_n: $Z_{(2^n)} \rightarrow V_n$
 bijective-mapping operation associating an element from $Z_{(2^n)}$ with its binary representation, i.e., for an element z of the ring $Z_{(2^n)}$, represented by the residue $z_0 + (2^1)z_1 + \dots + (2^{(n-1)})z_{(n-1)}$, where z_i in {0, 1}, $j = 0, \dots, n-1$, the equality $\text{Vec}_n(z) = z_{(n-1)}||\dots||z_1||z_0$ holds

Int_n: $V_n \rightarrow Z_{(2^n)}$
 the mapping inverse to the mapping Vec_n , i.e., $\text{Int}_n = \text{Vec}_n^{-1}$

MSB_n: $V^* \rightarrow V_n$
 the mapping associating the vector $z_{(k-1)}||\dots||z_1||z_0$, $k \geq n$, with the vector $z_{(k-1)}||\dots||z_{(k-n+1)}||z_{(k-n)}$

a := b operation of assigning the value b to the variable a

PS product of mappings, where the mapping S applies first

M binary vector subject to hashing procedure, M belongs to V^* , $|M| < 2^{512}$

H: $V^* \rightarrow V_n$
 hash function mapping the vector (message) M into the vector (hash code) $H(M)$

IV hash-function initializing value, IV in V_{512}

5. General Provisions

GOST R 34.11-2012 defines two hash functions $H: V^* \rightarrow V_n$ with the hash-code lengths $n = 512$ bits and $n = 256$ bits.

6. Parameter Values

6.1. Initializing Values

The initializing value IV for a hash function with a hash-code length of 512 bits is 0^{512} . The initializing value IV for a hash function with a hash-code length of 256 bits is $(00000001)^{64}$.

6.2. Nonlinear bijections of binary vector sets

Nonlinear bijection of the binary vector set V_8 is presented by the following substitution:

```
Pi = (Vec_8)Pi'(Int_8): V_8 -> V_8
```

where $\text{Pi}' : \mathbb{Z}_{(2^8)} \rightarrow \mathbb{Z}_{(2^8)}$.

The values of the substitution Pi' are presented in the array form
 $\text{Pi}' = (\text{Pi}'(0), \text{Pi}'(1), \dots, \text{Pi}'(255))$:

```
Pi' = (252, 238, 221, 17, 207, 110, 49, 22, 251, 196, 250,
      218, 35, 197, 4, 77, 233, 119, 240, 219, 147, 46,
      153, 186, 23, 54, 241, 187, 20, 205, 95, 193, 249,
      24, 101, 90, 226, 92, 239, 33, 129, 28, 60, 66,
      139, 1, 142, 79, 5, 132, 2, 174, 227, 106, 143,
      160, 6, 11, 237, 152, 127, 212, 211, 31, 235, 52,
      44, 81, 234, 200, 72, 171, 242, 42, 104, 162, 253,
      58, 206, 204, 181, 112, 14, 86, 8, 12, 118, 18,
      191, 114, 19, 71, 156, 183, 93, 135, 21, 161, 150,
      41, 16, 123, 154, 199, 243, 145, 120, 111, 157, 158,
      178, 177, 50, 117, 25, 61, 255, 53, 138, 126, 109,
      84, 198, 128, 195, 189, 13, 87, 223, 245, 36, 169,
      62, 168, 67, 201, 215, 121, 214, 246, 124, 34, 185,
      3, 224, 15, 236, 222, 122, 148, 176, 188, 220, 232,
      40, 80, 78, 51, 10, 74, 167, 151, 96, 115, 30,
      0, 98, 68, 26, 184, 56, 130, 100, 159, 38, 65,
      173, 69, 70, 146, 39, 94, 85, 47, 140, 163, 165,
      125, 105, 213, 149, 59, 7, 88, 179, 64, 134, 172,
      29, 247, 48, 55, 107, 228, 136, 217, 231, 137, 225,
      27, 131, 73, 76, 63, 248, 254, 141, 83, 170, 144,
      202, 216, 133, 97, 32, 113, 103, 164, 45, 43, 9,
      91, 203, 155, 37, 208, 190, 229, 108, 82, 89, 166,
      116, 210, 230, 244, 180, 192, 209, 102, 175, 194, 57,
      75, 99, 182)
```

6.3. Byte Permutation

The values of the permutation Tau belonging to S_64 are presented in the array form Tau = (Tau(0), Tau(1), ..., Tau(63)):

```
Tau = (0, 8, 16, 24, 32, 40, 48, 56,
       1, 9, 17, 25, 33, 41, 49, 57,
       2, 10, 18, 26, 34, 42, 50, 58,
       3, 11, 19, 27, 35, 43, 51, 59,
       4, 12, 20, 28, 36, 44, 52, 60,
       5, 13, 21, 29, 37, 45, 53, 61,
       6, 14, 22, 30, 38, 46, 54, 62,
       7, 15, 23, 31, 39, 47, 55, 63)
```

6.4. Linear Transformations of Binary Vector Sets

Linear transformation l of the binary vector set V_64 is specified by the right multiplication with the matrix A over the field GF(2). The matrix rows are specified sequentially in a hexadecimal form. The row with number j, j = 0, ..., 63 (specified in the form a_(j, 15)...a_(j, 0), where a_(j, i) belongs to Z_16, i = 0, ..., 15), is Vec_4(a_(j, 15))||...||Vec_4(a_(j, 0)).

```

Here one string contains 4 rows of the matrix A. So, the string with number i, i = 0, ..., 15, specifies 4 rows of the matrix A (with the numbers $4i + j$, j = 0, ..., 3) in the following left-to-right order: $4i + 0, 4i + 1, 4i + 2, 4i + 3$.

The product of the vector $b = b_{63} \dots b_0$ belonging to V_{64} and the matrix A is the vector c belonging to V_{64} :

```
c = b_63(Vec_4(a_(0, 15))||...||Vec_4(a_(0, 0)))      (xor)
...
b_0(Vec_4(a_(63, 15))||...||Vec_4(a_(63, 0)))      (xor)
```

where

```
b_i(Vec_4(a_(63-i, 15))||...||Vec_4(a_(63-i, 0))) =
= 0^64, if b_i = 0
= (Vec_4(a_(63-i, 15))||...||Vec_4(a_(63-i, 0))), if b_i = 1
for all i = 0, ..., 63.
```

6.5. Iteration Constants

Iteration constants are specified in a hexadecimal form. The constant value specified in the form $a_{127} \dots a_0$ (where a_i belongs to Z_{16} , $i = 0, \dots, 127$) is $\text{Vec}_4(a_{127})||\dots||\text{Vec}_4(a_0)$:

7. Transformations

For calculating the hash code $H(M)$ of the message M belonging to V^* , the following transformations are used:

```

X[k]: V_512 -> V_512,
X[k](a) = k (xor) a, k, a belongs to V_512;

S:V_512 -> V_512,
S(a) = S(a_63||...||a_0) = Pi(a_63)||...||Pi(a_0), where
a = a_63||...||a_0 belongs to V_512, a_i belongs to V_8,
i = 0, ..., 63;

```

```

P:V_512 -> V_512,
P(a) = P(a_63||...||a_0) = a_(Tau(63))||...||a_(Tau(0)), where
a = a_63||...||a_0 belongs to V_512, a_i belongs to V_8,
i = 0, ..., 63;

L:V_512 -> V_512,
L(a) = L(a_7||...||a_0) = l(a_7)||...||l(a_0), where
a = a_7||...||a_0 belongs to V_512, a_i belongs to V_64,
i = 0, ..., 7.

```

8. Round Functions

The hash-code value of the message M belonging to V^* is calculated using the iterative procedure. Each iteration is provided using the round function:

$g_N:V_512 \times V_512 \rightarrow V_512$, where N belongs to V_512

calculated as

$g_N(h, m) = E(LPS(h \oplus N), m) \oplus h \oplus m$

where

$E(K, m) = X[K[13]]LPSX[K[12]]\dots LPSX[K[2]]LPSX[K[1]](m)$

Values $K[i]$ belonging to V_512, $i = 1, \dots, 13$, are calculated as follows:

$K[1] = K$

$K[i] = LPS(K[i-1] \oplus C[i-1]), i = 2, \dots, 13$

9. Hash-Function Calculation Procedure

Initial data for the procedure of calculating the hash code $H(M)$ are a message M belonging to V^* (subject to hashing) and initializing value IV belonging to V_512. The algorithm for calculating the function H consists of the following steps.

Step 1. Assign initial values to the following variables:

1.1. $h := IV$

1.2. $N := 0^{512}$ belonging to V_512

1.3. $\text{EPSILON} := 0^{512}$ belonging to V_512

1.4. Go to Step 2.

Step 2.

2.1. Check the condition $|M| < 512$

If it is true, then go to Step 3.
Else, perform the following calculations:

2.2. Calculate the subvector m belonging to V_{512} of the message M :

$$M = M' \mid m$$

Then perform the following calculations:

2.3. $h := g_N(h, m)$

2.4. $N := \text{Vec}_{512}(\text{Int}_{512}(N) [+] 512)$

2.5. $\text{EPSILON} := \text{Vec}_{512}(\text{Int}_{512}(\text{EPSILON}) [+] \text{Int}_{512}(m))$

2.6. $M := M'$

2.7. Go to Step 2.1.

Step 3.

3.1. $m := 0^{511-|M|} \mid 1 \mid M$

3.2. $h := g_N(h, m)$

3.3. $N := \text{Vec}_{512}(\text{Int}_{512}(N) [+] |M|)$

3.4. $\text{EPSILON} := \text{Vec}_{512}(\text{Int}_{512}(\text{EPSILON}) [+] \text{Int}_{512}(m))$

3.5. $h := g_0(h, N)$

3.6. $h := g_0(h, \text{EPSILON})$, for function with 512-bit hash code
 $h := \text{MSB}_{256}(g_0(h, \text{EPSILON}))$, for function with 256-bit hash code

3.7. End of the algorithm

The value of the variable h (obtained in Step 3.6) is the value of hash function $H(M)$.

10. Examples (Informative)

This section is for information only and is not a normative part of the standard.

The vectors from V^* are specified in a hexadecimal form. The vector A belonging to $V_{(4n)}$ (specified in the form $a_{(n-1)} \dots a_0$, where a_i belongs to Z_{16} , $i = 0, \dots, n-1$) is $\text{Vec}_4(a_{(n-1)}) || \dots || \text{Vec}_4(a_0)$.

10.1. Example 1

Let's calculate the hash code of the following message (represented as a hexadecimal string):

```
M1 = 32313039383736353433323130393837
      36353433323130393837363534333231
      30393837363534333231303938373635
      343332313039383736353433323130
```

10.1.1. For Hash Function with 512-Bit Hash Code

Assign the following values to the variables:

```
h := IV = 0^512
```

```
N := 0^512
```

```
EPSILON := 0^512
```

The length of the message is $|M1| = 504 < 512$, so the incomplete block is padded:

```
m := 01323130393837363534333231303938
      37363534333231303938373635343332
      31303938373635343332313039383736
      35343332313039383736353433323130
```

Calculate

```
K := LPS(h (xor) N) = LPS(0^512).
```

After the transformation S:

```
S(h (xor) N) = fcfcfcfcfcfcfcfcfcfcfcfcfc
                  fcfcfcfcfcfcfcfcfcfcfcfcfcfc
                  fcfcfcfcfcfcfcfcfcfcfcfcfcfc
                  fcfcfcfcfcfcfcfcfcfcfcfcfcfc
```

after the transformation P :

after the transformation L :

```
K := LPS(h (xor) N) = b383fc2eced4a574b383fc2eced4a574  
                      b383fc2eced4a574b383fc2eced4a574  
                      b383fc2eced4a574b383fc2eced4a574  
                      b383fc2eced4a574b383fc2eced4a574
```

Then the transformation $E(K, m)$ is performed:

```

The result of the transformation $g_N(h, m)$ is

```
h = fd102cf8812ccb1191ea34af21394f38
    17a86641445aa9a626488adb33738ebd
    2754f6908cbbbac5d3ed0f522c50815c
    954135793fb1f5d905fee4736b3bdae2
```

Variables N and EPSILON change their values to

```
N      = 00000000000000000000000000000000
          00000000000000000000000000000000
          00000000000000000000000000000000
          00000000000000000000000000000001f8
```

```
EPSILON = 01323130393837363534333231303938
          37363534333231303938373635343332
          31303938373635343332313039383736
          35343332313039383736353433323130
```

The result of the transformation $g_0(h, N)$ is

```
h = 5c881fd924695cf196c2e4fec20d14b6
    42026f2a0b1716ebaabb7067d4d59752
    3d2db69d6d3794622147a14f19a66e7f
    9037e1d662d34501a8901a5de7771d7c
```

The result of the transformation $g_0(h, \text{EPSILON})$ is

```
h = 486f64c1917879417fef082b3381a4e2
    11c324f074654c38823a7b76f830ad00
    falfb42b1285c0352f227524bc9ab1
    6254288dd6863dccc5b9f54a1ad0541b
```

The hash code of the message $M1$ is the value

```
H(M1) = 486f64c1917879417fef082b3381a4e2
    11c324f074654c38823a7b76f830ad00
    falfb42b1285c0352f227524bc9ab1
    6254288dd6863dccc5b9f54a1ad0541b
```

10.1.2. For Hash Function with 256-Bit Hash Code

Assign the following values to the variables:

```
h := IV = (00000001)^64
```

```
N := 0^512
```

```
EPSILON := 0^512
```

The length of the message is $|M1| = 504 < 512$, so the incomplete block is padded:

```
m := 01323130393837363534333231303938
    37363534333231303938373635343332
    31303938373635343332313039383736
    35343332313039383736353433323130
```

Calculate

```
K := LPS(h (xor) N) = LPS((00000001)^64)
```

After the transformation S:

```
S(h (xor) N) = eeeeeeeeeeeeeeeeeeeeeeeeeeeee
    eeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeee
    eeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeee
    eeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeee
```

after the transformation P:

```
PS(h (xor) N) = eeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeee
                eeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeee
                eeeeeeeeeeeeeeeeeeeeeeeeeeeee
                eeeeeeeeeeeeeeeeeeeeeeeeeeeee
```

after the transformation L:

```
K := LPS(h (xor) N) = 23c5ee40b07b5f1523c5ee40b07b5f15
                      23c5ee40b07b5f1523c5ee40b07b5f15
                      23c5ee40b07b5f1523c5ee40b07b5f15
                      23c5ee40b07b5f1523c5ee40b07b5f15
```

Then the transformation E(K, m) is performed:

          31303938373635343332313039383736
          35343332313039383736353433323130
```

The result of the transformation $g_0(h, N)$ is

```
h = 70f22bada4cf18a6a56ec4b3f328cd4
    0db8e1bf8a9d5f711d5efab11191279d
    715aab7648d07eddbf87dc79c80516e6
    ffccbcf5678b0ac29ea00fa85c8173cc6
```

The result of the transformation $g_0(h, \text{EPSILON})$ is

```
h = 00557be5e584fd52a449b16b0251d05d
    27f94ab76cbaa6da890b59d8ef1e159d
    2088e482e2acf564e0e9795a51e4dd26
    1f3f667985a2fcc40ac8631fac1709a
```

The hash code of the message M_1 is the value

```
H(M1) = 00557be5e584fd52a449b16b0251d05d
    27f94ab76cbaa6da890b59d8ef1e159d
```

10.2. Example 2

Let's calculate the hash code of the following message:

```
M2 = fbe2e5f0eee3c820fbeafaebe20ffffb
    f0e1e0f0f520e0ed20e8ece0ebe5f0f2
    f120fff0eeec20f120faf2fee5e2202c
    e8f6f3ede220e8e6eee1e8f0f2d1202c
    e8f0f2e5e220e5d1
```

10.2.1. For Hash Function with 512-Bit Hash Code

Assign the following values to the variables:

```
h := IV = 0^512
```

```
N := 0^512
```

```
EPSILON := 0^512
```

The length of the message is $|M_2| = 576 > 512$, so a part of this message is initially transformed:

```
m :=fbeafaebe20ffffbf0e1e0f0f520e0ed
    20e8ece0ebe5f0f2f120fff0eeec20f1
    20faf2fee5e2202ce8f6f3ede220e8e6
    eee1e8f0f2d1202ce8f0f2e5e220e5d1
```

Calculate

```
K := LPS(h (xor) N) = LPS(0^512)
```

After the transformation S:

after the transformation P :

after the transformation ψ :

```
LPS(h (xor) N) = b383fc2eced4a574b383fc2eced4a574  
                  b383fc2eced4a574b383fc2eced4a574  
                  b383fc2eced4a574b383fc2eced4a574  
                  b383fc2eced4a574b383fc2eced4a574
```

Then the transformation $E(K, m)$ is performed:

Iteration 1

```

          eee1e8f0f2d1202ee4d3d8d6d104adf1
```

The result of the transformation $g_0(h, N)$ is

```
h = 4deb6649ffa5caf4163d9d3f9967fbbd
    6eb3da68f916b6a09f41f2518b81292b
    703dc5d74e1ace5bcd3458af43bb456e
    837326088f2b5df14bf83997a0b1ad8d
```

The result of the transformation $g_0(h, \text{EPSILON})$ is

```
h = 28fbc9bada033b1460642bdcd90c3f
    b3e56c497cccd0f62b8a2ad4935e85f03
    7613966de4ee00531ae60f3b5a47f8da
    e06915d5f2f194996fcabf2622e6881e
```

The hash code of the message M_2 is the value

```
H(M2) = 28fbc9bada033b1460642bdcd90c3f
        b3e56c497cccd0f62b8a2ad4935e85f03
        7613966de4ee00531ae60f3b5a47f8da
        e06915d5f2f194996fcabf2622e6881e
```

10.2.2. For Hash Function with 256-Bit Hash Code

Assign the following values to the variables:

```
h := IV = (00000001)^64
```

```
N := 0^512
```

```
EPSILON := 0^512
```

The length of the message is $|M_2| = 576 > 512$, so a part of this message is initially transformed:

```
m := fbeafabef20fffbf0e1e0f0f520e0ed
20e8ece0ebe5f0f2f120fff0eec20f1
20faf2fee5e2202ce8f6f3ede220e8e6
eee1e8f0f2d1202ce8f0f2e5e220e5d1
```

Calculate:

```
K := LPS(h (xor) N) = LPS((00000001)^64)
```

After the transformation S:

```
S(h (xor) N) = eeeeeeeeeeeeeeeeeeeeeeeeeeeee
eeeeeeeeeeeeeeeeeeeeeeeeeeeeeeee
eeeeeeeeeeeeeeeeeeeeeeeeeeeeeeee
eeeeeeeeeeeeeeeeeeeeeeeeeeee
```

after the transformation P:

```
PS(h (xor) N) = eeeeeeeeeeeeeeeeeeeeeeeeeeeee
eeeeeeeeeeeeeeeeeeeeeeeeeeeeeeee
eeeeeeeeeeeeeeeeeeeeeeeeeeeeeeee
eeeeeeeeeeeeeeeeeeeeeeeeeeee
```

after the transformation L:

```
K := LPS(h (xor) N) = 23c5ee40b07b5f1523c5ee40b07b5f15
23c5ee40b07b5f1523c5ee40b07b5f15
23c5ee40b07b5f1523c5ee40b07b5f15
23c5ee40b07b5f1523c5ee40b07b5f15
```

Then the transformation $E(K, m)$ is performed:

Iteration 1

```

```
EPSILON = fbeafaebef20ffffbf0e1e0f0f520e0ed
          20e8ece0ebe5f0f2f120fff0eec20f1
          20faf2fee5e2202ce8f6f3ede220e8e6
          eee1e8f0f2d1202ce8f0f2e5e220e5d1
```

The length of the rest of the message is less than 512, so the incomplete block is padded:

```
m = 00000000000000000000000000000000
    00000000000000000000000000000000
    00000000000000000000000000000000
    00000000000000001fbe2e5f0eee3c820
```

The result of the transformation $g_N(h, m)$ is

```
h = a69049e7bd076ab775bc2873af26f098
    c538b17e39a5c027d532f0a2b3b56426
    c96b285fa297b9d39ae6af8b9001d97
    bb718a65fcc53c41b4ebf4991a617227
```

The variables N and EPSILON change their values to

```
N      = 00000000000000000000000000000000
        00000000000000000000000000000000
        00000000000000000000000000000000
        00000000000000000000000000000000240
```

```
EPSILON = fbeafaebef20ffffbf0e1e0f0f520e0ed
          20e8ece0ebe5f0f2f120fff0eec20f1
          20faf2fee5e2202ce8f6f3ede220e8e6
          eee1e8f0f2d1202ee4d3d8d6d104adf1
```

The result of the transformation $g_0(h, N)$ is

```
h = aee3bd55ea6f387bcf28c6dcdbbf3d  
dacc67dcc13dbd8d548c6bf808111d4b  
75b8e74d2afae960835ae6a5f0357555  
9c9fd839783ffcd5cf99bd61566b4818
```

The result of the transformation $g_0(h, \text{EPSILON})$ is

```
h = 508f7e553c06501d749a66fc28c6cac0  
b005746d97537fa85d9e40904efed29d  
c345e53d7f84875d5068e4eb743f0793  
d673f09741f9578471fb2598cb35c230
```

The hash code of the message M2 is the value

```
H(M2) = 508f7e553c06501d749a66fc28c6cac0  
b005746d97537fa85d9e40904efed29d
```

11. Security Considerations

This entire document is about security considerations.
